### 1.1 Purpose

Recognizing that the intersection of SR 21 and SR 100 serves as a gateway into the City of Keystone Heights, the North Florida Transportation Planning Organization (TPO) in conjunction with the City of Keystone Heights initiated a planning study to evaluate the performance of the intersection and recommend improvements that enhance performance and safety for all modes of transportation including vehicles, bicyclists, and pedestrians.

### 1.2 Objective

The objective of this study is to identify, evaluate, and develop operational and safety improvements to improve the functionality of the intersection. Elements evaluated as part of this study included:

- Optimization of existing signal timings
- Enhanced pavement markings
- Addition/modification of turn lanes
- Enhanced pedestrian crossings

### 1.3 Background

The SR 21/SR 100 Intersection Study was initiated by the City of Keystone Heights and funded by the North Florida TPO as a transportation planning study that investigates the operational performance of the SR 21/SR100 intersection.

### 1.4 Study Location

The study intersection is located within the City of Keystone Heights in Clay County, Florida. This intersection provides a northern entrance, or gateway, into downtown Keystone Heights on SR 21.

## SECTION 2. Existing Conditions

### 2.1 Intersection Characteristics

SR 21 near SR 100 is a two-lane undivided urban minor arterial with a posted speed limit of 30 MPH approaching the SR 100 intersection. This portion of SR 21 runs primarily north and south and has an access management classification of Access Class 06. SR 21 has 12-foot trave lanes and curb and gutter. There are sidewalks along each approach to the intersection. There are no bike lanes or paved shoulders along either roadway. See Figure 2-1 for an aerial of the intersection.

The intersection is signed, striped, and signalized with the following geometry:

- Northbound SR 21: One left-turn lane and one through/right-turn lane
- Southbound SR 21: One left-turn lane, one through lane, and one right-turn lane
- Eastbound SR 100: One left-turn lane and one through/right-turn lane
- Westbound SR 100: One left-turn lane and one through/right-turn lane

### 2.2 Intersection Geometry

SR 21 at SR 100 is skewed intersection, further defined by lane striping for SB right/through and SB left turn movements. The WB SR 100 to NB SR 21 traffic must make an immediate "right turn only" into the Walgreens parking lot, or merge left to the NB through lane, after turning. The decision point directly after the WB to NB turn is abrupt.

The acute angle between NB SR 21 to EB SR 100 is 46 degrees, making all right turns difficult for trucks without departing from the designated striped lanes. Figure 2-2 indicates the intersection approach angles.

Figure 2-2. Intersection Geometry

### 2.3 Intersection Striping

Intersection lane markings have been recently repainted and include high emphasis crosswalks at all approaches as well as new markings to more clearly delineate the SR 21 northbound right turn only lane into the Walgreens on the northeast corner of the intersection. The on-street parking pavement markings have also been refreshed on SR 21 south of the intersection. Crosswalks in all four directions are longer than optimum for comfortable walk times, with the two with the sharpest skew being the longest.

### 2.4 Context Classification

SR 21 and SR 100 both have a context classification of Rural Town (C2T). According to the FDOT Context Classification Guide, the rural town classification exhibits small concentrations of development areas immediately surrounded by rural and natural areas. This classification includes many historic towns. SR 21, south of the intersection through the small business district, acts as a gateway to the town center. Figure 2-3 illustrates this classification.

Figure 2-3. FDOT Context Classification Guide Description

### 2.5 Right of Way/Parcel Boundaries

Parcel boundaries were obtained from the Clay County Property Appraiser. This parcel data was used to assume general right-of-way (ROW) boundaries adjacent to both SR 21 and SR 100. Figure 2-4 illustrates the existing ROW and parcel boundaries adjacent to the intersection.

Figure 2-4. Existing Parcel and Right of Way Boundaries

### 2.6 Existing Land Use

Existing land use adjacent to the SR 21/SR 100 intersection was determined using the Generalized Land Use Derived from 2021 Florida Parcels dataset from the University of Florida's GeoPlan Center. The dataset was created for FDOT and generalizes 99 available land uses into 15 land use classifications. As displayed in Figure 2-5, predominant land uses adjacent to the intersection are commercial and public uses. Two large residential developments are scheduled to be constructed within the next few years. This growth was accounted for in the growth rate used for the traffic analysis in the near-term years.

Figure 2-5. Existing Land Use

District Two Traffic Operations

### 2.7 Previous Studies

The FDOT District 2 Traffic Operations Office completed an intersection review of the SR 21 at SR 100 intersection in January 2020 (Section No. 71110000 , MP 6.245 , Clay County) with the principal purpose of determining traffic turning movements, and specifically north bound SR 21 right turns to east bound SR 100. The District received a request from an individual (unidentified in the report) to study the turning movements. The intersection review report also identified potential new development in the area but with no identification as to where or when this will occur.

The observed turning movement data was provided in Table 1 of the District's report: SR 21 Northbound Right-Turn Volumes varied from 16 to 30 (the peak during 3:00 PM to 4:00 PM).

A field review was performed on December 3, 2019, from 8:45 AM to 9:45 AM to document existing conditions during which very few NB right turns were observed. The District's report did state, "There was evidence that the northbound right-turn movement has off-tracked onto the curb, but no evidence of prolonged wear (cracked curb, sidewalk, etc.)." Given that few NB right turns are made from SR 21 to SR 100, local knowledge of difficult turning movement may mean that local drivers avoid the turns.

The District's report Conclusions and Recommendations section (2020) provides the following: "Based on the field review, crash analysis, and right-turn lane evaluation, a right-turn lane is not recommended at this time. The field review and office review found that the existing volumes of northbound right-turns did not meet or exceed the recommended thresholds outlined in the FDOT Driveway Information Guide. (The threshold cited as justification for a right turn lane for a $30-\mathrm{mph}$ two lane roadway is 80 right-turning vehicles per hour, and the maximum number of right turns at this intersection during the twelve hours observed was 30.) Additionally, there is no crash history of northbound rear-ends that was attributed to vehicles slowing to turn right. No other operational improvements are recommended."

FDOT has recently completed a project that involved painting high emphasis crosswalks at the intersection as well as new striping for parking on SR 21 south of SR 100

## SEction 3. Traffic Analysis

### 3.1 Data Collection

3.1.1. Tube Counts

Twenty-four-hour tube counts were collected on SR 21 and SR 100 over a three-day period (October 25-27, 2022) at four locations. These locations were:

- SR 21 north of SR 100
- SR 21 south of SR 100
- SR 100 east of SR 21
- SR 100 west of SR 21

### 3.1.2. Turning Movement Counts

Turning movement counts (TMC) were collected for eight hours on Thursday, October 27, 2022. The counts captured the AM and PM peak periods at the SR 100 at SR 21 intersection. The TMCs included vehicle classification between passenger vehicles, heavy vehicles, pedestrians, and bicyclists.

The turning movement counts were not adjusted by a seasonal adjustment factor as the seasonal adjustment factor from the 2021 Clay County Season Factor Report is less than 1.00 based on the time of year the counts were performed, indicating that the counts were collected during peak season conditions

### 3.2 Existing Traffic Conditions

Utilizing traffic data collected as part of this study, the SR 21/SR 100 intersection and the surrounding approaches were evaluated to determine existing traffic characteristics. Figure 3-1 illustrates existing turning movement counts for the intersection.

Figure 3-1. Existing Turning Movement Counts

### 3.3 Traffic Forecasting

### 3.3.1. Historical Traffic Counts

A ten-year historical trends analysis was performed using traffic count data for the most recently available AADT from FDOT's Florida Traffic Online database. Four locations were available within the study area and are listed below. Table 3-1 provides the AADT estimate between 2012 with 2021.

| Table 3-1. Historical Traffic Counts |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Count Location | Count ID | 2012 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 |
| SR 100 - West of SR 19 | 710168 | 9,900 | 10,500 | 10,500 | 11,000 | 11,000 | 12,000 | 12,000 | 11,000 | 12,000 | 12,000 |
| SR 100 - East of SR 19 | 710110 | 10,600 | 11,400 | 11,200 | 11,500 | 11,700 | 11,000 | 12,100 | 11,900 | 11,300 | 12,800 |
| SR 19 - North of SR 100 | 710164 | 9,500 | 10,000 | 9,700 | 10,000 | 10,000 | 10,500 | 10,500 | 11,500 | 10,000 | 11,500 |
| SR 19 - South of SR 100 | 710014 | 5,700 | 6,000 | 5,900 | 6,000 | 6,500 | 6,800 | 7,200 | 7,000 | 7,200 | 7,200 |

### 3.3.4. Growth Rate Summary

The recommended growth rate was selected by comparing all of the forecasts and accounting for the variability in the different methods (Table 3-4). The three methods of growth analytics are provided for comparison in the table below. Based on the variability a suggested annual growth rate of $1.5 \%$ is proposed for the study area.

### 3.3.5. Future Turning Movement Counts

The 1.5\% annual growth rate was applied to the existing turning movement counts to determine future year 2050 turning movements.
The design year (2050) traffic utilized the $1.5 \%$ annual growth rate except for the first two years which utilized a $2 \%$ growth rate due to multiple residential developments being constructed in the area during the next two years. Additionally, a seven (7) second leading pedestrian interval was modeled as part of the signal timings in both the existing and future conditions.

Free flow operations. Vehicles can move freely within the traffic stream.

D) Reasonably free flow operations. The ability to move within the traffic stream is only slightly restricted.

Flow with speeds at or near free flow. Freedom to maneuver within the traffic stream is noticeably restricted and lane changes require more effort on the part of the driver.

The facility has almost reached its capacity. Operations are unstable because there are virtually no gaps in the traffic stream. There is little or no room to move.

### 3.4 Intersection Level of Service Analysis

An operational analysis of the intersection was performed for existing traffic with current geometry and for a design year of 2050 with No-Build conditions. The intersection traffic analysis was conducted using Synchro (version 11) traffic software, which uses the HCM methodology to determine intersection delay and level of service (LOS). LOS is a measurement of congestion determined by the number of vehicles on a roadway in relation to the capacity of the roadway. LOS standards assign a grade of LOS A (least congestion) to LOS F (most congestion) to a roadway facility (see Figure 3-2).

### 3.4.1. 2022 Existing and 2050 No Build Intersection Performance Results

The results of the 2022 existing traffic analysis indicate that the overall intersection currently operates within target LOS (LOS D or better) in both the AM and PM peak hour for existing and future volumes. A slight improvement in northbound and southbound approach delays for the AM peak hour can be attributed to an increase in green time utilization for those approaches with the 2050 volumes. Signal timings for future year signalized intersections were optimized using Synchro's optimization tool to achieve comparable intersection operating conditions and traffic progression to regular Transportation Systems Management and Operations (TSM\&O) signal retiming maintenance. Table 3.5 summarizes the existing and future no build intersection performance results.
An operational analysis of the project's intersection was performed for existing traffic with current geometry and for a design year of 2050 with No-Build conditions. The intersection traffic analysis was conducted using Synchro (version 11) traffic software, which uses the HCM methodology to determine intersection delay and level of service (LOS) as shown in Table 3-5.

| Intersection | Year | Table 3-5. Existing and Future No Build Intersection Performance |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | AM |  |  |  |  |  |  |  |  |  | PM |  |  |  |  |  |  |  |  |  |
|  |  | EB |  | WB |  | NB |  | SB |  | Overall |  | EB |  | WB |  | NB |  | SB |  | Overall |  |
| $\begin{aligned} & \text { SR } 100 \text { and } \\ & \text { SR } 21 \end{aligned}$ | 2022 | 15.4 | (B) | 16.9 | (B) | 57.6 | (E) | 59.2 | (E) | 34.7 | (C) | 20.8 | (C) | 26.6 | (C) | 55.3 | (E) | 47.7 | (D) | 34.7 | (C) |
|  | 2050 | 22.4 | (C) | 25.4 | (C) | 54.6 | (D) | 63.2 | (E) | 36.9 | (C) | 60.8 | (E) | 62.6 | (E) | 56.4 | (E) | 47.8 | (D) | 56.9 | (E) |
|  |  |  |  |  |  |  |  |  |  |  | $5$ |  |  | W8 |  |  |  |  |  |  |  |

### 3.4.2. 2022 and 2050 Build Intersection Performance Results

The Build scenario of this intersection has the same existing geometry with the exception of an additional northbound channelized right-turn lane. The northbound approach for the build scenario thus has a left turn lane, a through lane, and a channelized right turn lane.

The results of the 2050 Build traffic analysis indicate an improvement in the overall intersection which operates within target LOS (LOS D or better) in both the AM and PM peak hour for existing and future volumes. The northbound approach also experiences a noticeable improvement and operates within target LOS (LOS D or better) for both Build scenario peak hours and volumes. Table 3-6 summarizes the existing and future build intersection performance results.

| Table 3-6. Existing and Future Build Intersection Performance |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Intersection | Year | AM |  |  |  |  |  |  |  |  |  | PM |  |  |  |  |  |  |  |  |  |

### 4.1 Crash Evaluation

Existing crash data was obtained from the Signal 4 Analytics (S4) database for the five-year period from 2018 to 2022. The S4 database was developed by the GeoPlan Center at the University of Florida using crash records provided by the Florida Department of Highway Safety and Motor Vehicles (DHSMV). A review of the crash data indicated a total of 68 crashes within a 600 ' radius of the intersection of SR 21/SR 100 for the study period. Of these crashes, there were no fatal crashes or crashes involving bicyclists and/or pedestrians. Two crashes resulted in serious injuries and six crashes resulted in an injury. The results of the crash evaluation are summarized in this section.

The most common crash type was Rear End, with 35 crashes. Leftturn and angle crashes were the second most frequent crash types with 7 crashes each, as shown in Figure 4-1.

Figure 4-1. Crashes by Type

The year 2022 saw the highest number of crashes with 18. The years 2018 through 2020 experienced the fewest crashes with 12 per year.

Figure 4-2. Crashes by Year

Monday experienced the highest number of crashes during the week with Saturday experiencing the fewest

Figure 4-3. Crashes by Day of Week

A majority of crashes (54) occurred during daylight conditions. Fourteen crashes occurred in dark conditions.

Figure 4-4. Crashes by Lighting Conditions
The number of crashes peaked in the afternoon hours from 3 p.m. to 6 p.m.

Most crashes (62) occurred on dry road surface conditions. The remaining crashes (6) occurred on wet road surface conditions

Figure 4-6. Crashes by Roadway Condition

### 5.1 Proposed Improvements

Based on the FDOT guidance, the SR 21/SR 100 intersection analysis notes a wide range of intersection treatments through a similarly wide range of complexity, contexts, and costs. Priorities can be set by complexity, cost, local preference, and right-of-way availability. Needed safety and operational improvements at the SR 21/SR 100 intersection include new and modified lane striping, crosswalk remediation, access management, signal modifications, and sight distance improvements Figure 5-1 illustrates a concept plan of the improvements.

### 5.2 Pavement Markings

### 5.2.1. Skip Lines and New Crosswalks

A low-cost improvement for vehicular safety would be to provide new skip line striping to better represent and define turning movements in each direction. To eliminate long crosswalk distances, new crosswalks could be incorporated to align more perpendicular to the crossings and with relocated stop bars to direct traffic to stop short of the crosswalks. Crosswalks crossing diagonally do not follow the direction of leading or intercepting sidewalks, and the shortened walk distance shown in the concept is a safer alternative.

### 5.2.2. WB SR 100 to NB SR 21 Right Turn Lane Delineation

There is an abrupt right turn lane leading to the Walgreens entrance, immediately after the WB SR 100 to NB SR 21 right turn movement. A painted bump-out gore could be added to direct traffic directly to the NB SR 21 through lane, and then new markings and signage could be added to the right turn only lane to the CVS driveway entrance in addition to the "right lane must turn right" signage that exists currently. This improvement would remove the potential for rear end collisions by right turning vehicles that follow a vehicle intending to immediately turn right into the Walgreens site.

### 5.3 Signal Improvements

### 5.3.1. Signal Timing

Low-cost signal retiming changes could be made to allow safer pedestrian crossing within the proposed new crosswalks.

### 5.3.2. Lead Pedestrian Interval

A leading pedestrian interval (LPI) incorporated into the signal timing gives pedestrians the opportunity to enter the crosswalk at an intersection three to seven seconds before the vehicles are given a green light. Pedestrians can better establish their presence in the crosswalk before vehicles have priority to turn right or left. Signal timing changes are lower cost, early intervention safety improvements that can be done in an early phase of intersection improvements. A signal timing study could be initiated by asking FDOT District staff or a consultant to perform a study and/ or optimization adjustment recommendations. The analysis performed in Section 3.4.2 reflects an LPI of 7 seconds in the level of service calculation.

### 5.3.3. Signal Backplates

Adding retro-reflective signal backplates is also a low-cost safety countermeasure. SR 100 is aligned east-west, and at times with low sun angles, signals can be obscured by glare. Backplates should not be installed on the existing strain pole signals but would be an important safety feature on improved mast arm signals. Through field evaluation, background glare was observed which interferes with visual detection of the signals.

### 5.4 Intersection Design

### 5.4.1. Dedicated Northbound SR 21 Right-turn Lane

The vacant China Chef restaurant on the SE corner of the intersection is the first gateway introduction to the revitalized SR 21 S Lawrence Road downtown corridor. As noted previously, a dedicated NB SR 21 right turn lane would provide a safety improvement for the intersection. According to the FHWA Office of Safety, Proven Safety Countermeasures, the safety benefit of a dedicated right turn lane at an intersection is a $14 \%$ to $26 \%$ reduction in total crashes. The difficult northbound to eastbound 46-degree acute angle right turn at this intersection can only be accomplished by slow moving vehicles leading to a higher probability of rear end crashes. The turning movement for larger trucks is also difficult, requiring the vehicle to begin the turn at the left of the right turn lane and end it either in, or encroaching upon the WB SR 100 left turn lane. The addition of a right-turn lane would require the purchase of the existing vacant business parcel (Parcel \# 022006-000-00). A concept for this improvement is discussed in further detail in Section 5.5.

### 5.4.2. SB SR 21 Right Turn Movement

To segregate SB SR 21 to WB SR 100 right turning vehicles and to provide crosswalk pedestrian safe havens, a curbed directional traffic separator median could be built at moderate cost. This would shorten the walk distance across through lanes and provide a more direct crosswalk alignment than exists presently.
Appropriate pedestrian crosswalk notification and yield signs should be installed prior to and at the crosswalk. Shark teeth pavement markings should be included along with yield conditions signage prior to advancing to WB SR 100.
This separator island would be located where the wear pattern on the street surface would indicate the turning movements today. A lower cost alternative that may be done in advance of the curbed median would be to define the condition with pavement markings.
An Autoturn analysis was performed at this intersection and it was determined that a smaller semi-truck (WB-40) could navigate this turning movement with a raised separator. However, the largest semitruck (WB-62FL) would necessitate a smaller raised separator in order to make the turn (See Appendix C). Further engineering design and analysis would need to occur in order to determine the appropriate size of a traffic separator at this location.

Figure 5-1. SR 21/SR 100 Concept Plan

### 5.5 Turn Lane and Parking Area Concept

The focus of the SR 21/SR 200 Intersection Study was on the turning movements required in each direction on both roadways. The most difficult turning movement is an acute, 46-degree angle northbound right turn from SR 21 to SR 100 requiring large wheelbase vehicles to encroach left into the left turn lane on SR 21 and turning close to or into the left turn lane on SR 100. One solution discussed was to provide a dedicated right turn lane on SR 21 and provide a directional curbed median that would provide for right turns, but also allow a safer visible pedestrian crossing in a crosswalk across the right turn lane. To allow for the new right turn lane, acquisition of a parcel on the southeast corner would be required. An Autoturn analysis was performed to determine the appropriate turning radius for the NB right turn movement (See Appendix C). The concepts shown in the following pages represent an appropriate radius that would accommodate large semitrucks.

### 5.5.1. Proposed Parking Area

A concept for adaptive reuse of the acquired parcel for both a parking area and public space was considered and developed. Later, the concept was revised to investigate creating additional public parking on the acquired parcel, while developing arrangements that improved the parking for the remaining adjacent structure-a potential public-private partnership arrangement.

Figure 5-2 and Figure 5-3 on the following pages illustrate the proposed turn lane and parking area concept with the ROW boundaries overlaid. It should be noted that this concept was developed as a desktop exercise using available GIS data. No field survey data was collected. Any future concept would need to go through a thorough design and engineering process. The acreage calculations are approximations for the reuse of parcel \#022006-000-00 and are for reference only.

### 5.6 Public Parking

Through discussions with the City of Keystone Heights, the original concept was revised to show parking on the publicly acquired parcel shared with the existing private parking already in place. Approximately eight additional parking spaces could be added depending on the chosen site layout, and these additional spaces would mitigate the loss of one or two of the on-street parking spaces that would be used to create the right-turn lane.

### 5.7 Access Management

The parking concept plan indicates removal of the existing driveway access from SR 21 to the parking lot to eliminate it from close proximity to the intersection. Access to the new parking lot arrangement will be from SR 100 and Beasley Lane with a shared driveway with the existing parking lots. That would be a safe location for a full access driveway allowing left turns in from the median left turn lane, and out to the left turn lane.

新

This study focused on identifying problem areas at the SR 21/SR 200 intersection and providing recommendations to improve existing and future operations of the intersection as well as enhance multimodal mobility and safety for all users. The goal of the parking area concept is to reuse an existing vacant parcel to provide a safer turning movement to accommodate large trucks making a northbound right turn as well as to provide an entrance feature to downtown Keystone Heights.
Some of the recommendations identified as part of this study could be completed incrementally as funding becomes available. Table 6-1 provides a summary of all recommended improvements by phase.

| Category | Proposed Improvement | Anticipated Effectiveness |
| :---: | :---: | :---: |
| Short-Term Improvements |  |  |
| Pavement Markings | Skip Lines | There are no skip lines through the intersection currently. For this skewed intersection, skip lines would visually aid driver making turn movements. |
|  | WB SR 100 to NB SR 21 Right Turn Delineation | A striped area for the WB SR 100 to NB SR 21 would prompt drivers to turn right into the through NB lane and then move into the right turn only lane to the Walgreens driveway after the turn which would decrease driver confusion and last second merging. |
| Signal Enhancements | Lead Pedestrian Interval (LPI) | Lead pedestrian interval signal timing would benefit pedestrians crossing multiple lanes and the additional crossing time could be added to the countdown timer pedestrian signal head. Audible countdowns could also be installed to aid sight limited individuals. These crossing aids would encourage pedestrian activity within the town center/business district. The analysis performed in Section 3.4.2 reflects a LPI of 7 seconds in the level of service calculation. |
| Medium-Term Improvements |  |  |
| Intersection Design | Curbed Traffic Island SB SR 21 Right Turn Movement | The curbed traffic separator island at the NW quadrant of the intersection would make both vehicular turning movements and pedestrian crossings more predictable and controlled. The SB SR 21 to WB SR 100 right turn would be a yield-to-pedestrians movement at the pedestrian crossing and would be a safer right-turn on red after stop condition when entering WB SR 100 traffic. |
| Long-Term Improvements |  |  |
| Signal Enhancements | Mast Arm Signals | Mast arm signals could be installed to more directly face the drivers approaching the intersection in each direction. The stability advantage for maintenance during high wind events would be improved. |
|  | Signal Backplates | Signal backplates would improve signal visibility in low sun conditions on SR 100. Images indicate high glare conditions at times in both eastbound and westbound directions. |
| Intersection Design | Dedicated Northbound SR 21 Right-turn Lane | Intersection redesigns and construction are higher cost elements that can improve safety and operations at the SR 21/SR 100 intersection. If property acquisition can be accomplished to obtain right-of-way for the right turn lane, improvements to turning movements and pedestrian safety can be made. |
| Parking Area Concept | Construction of a new sign feature on SE corner of intersection | The Parking Area Concept would provide a monument feature delineating the entrance into downtown Keystone Heights. It would allow for additional parking spaces as well as provide a more pedestrian-friendly environment on that quadrant of the intersection. It would also provide a visually appealing sign feature to the downtown area. |
