Purpose

This report summarizes the technical methods used in the development of the Strategic Safety Plan.

Methods

The methodology used in this project is summarized in Figure 1.

Figure 1. Roadmap

Data Sources and Cleaning

There were significant data quality issues in the data downloaded from Signal4Analytics.

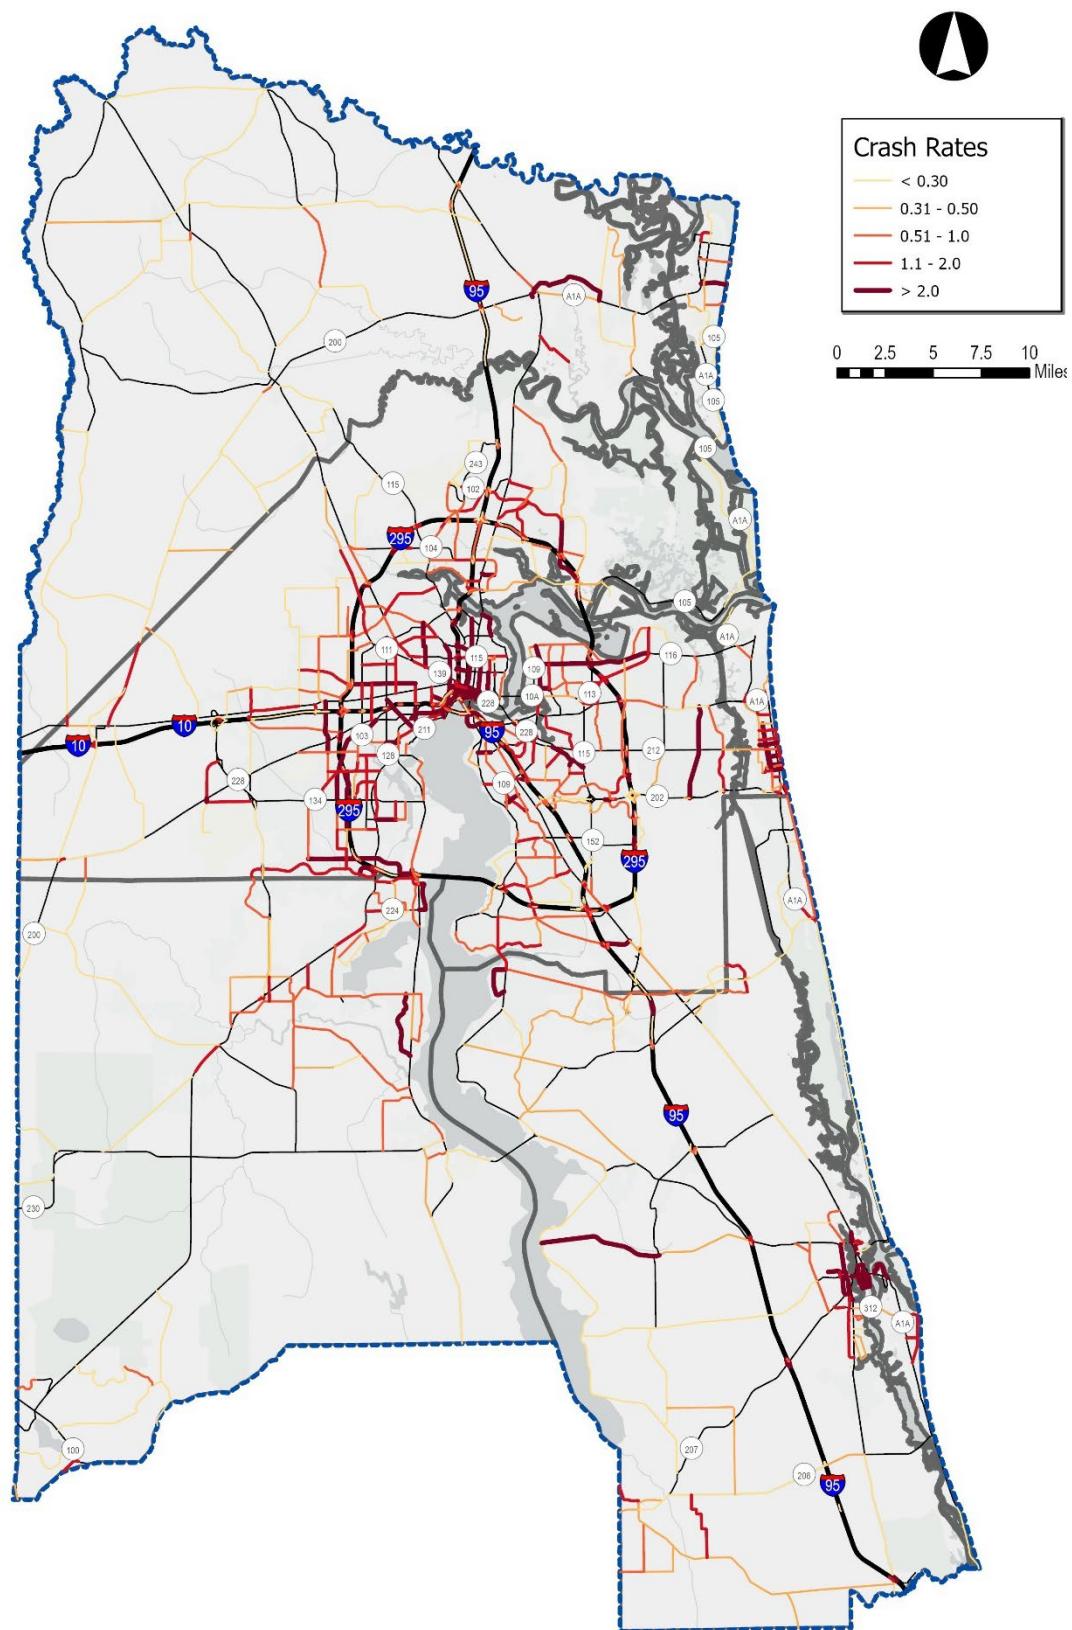

Traffic Data

Traffic data was used from the FDOT's AADT shapefile available at <https://www.fdot.gov/statistics/gis/default.shtm#Traffic>. Annual Average Daily Traffic (AADT) and other traffic factors are included. A final data set was retrieved on August 11, 2023. The metadata are also provided on that website. The traffic data was assigned to the 430 roadway segments.

Roadway Network

The facilities are shown on Figure 1. The analysis network was based on the Florida Department of Transportation (FDOT) AADT network. It includes all state roads, and other arterials and major collectors managed by local governments in Clay, Duval, Nassau and St. Johns Counties.

Figure 2. Analysis Network

The final data set used was retrieved on August 10, 2023.

<https://www.fdot.gov/statistics/gis/default.shtm#Traffic>

The network consists of 430 roadway segments and 2,025.2 centerline miles.

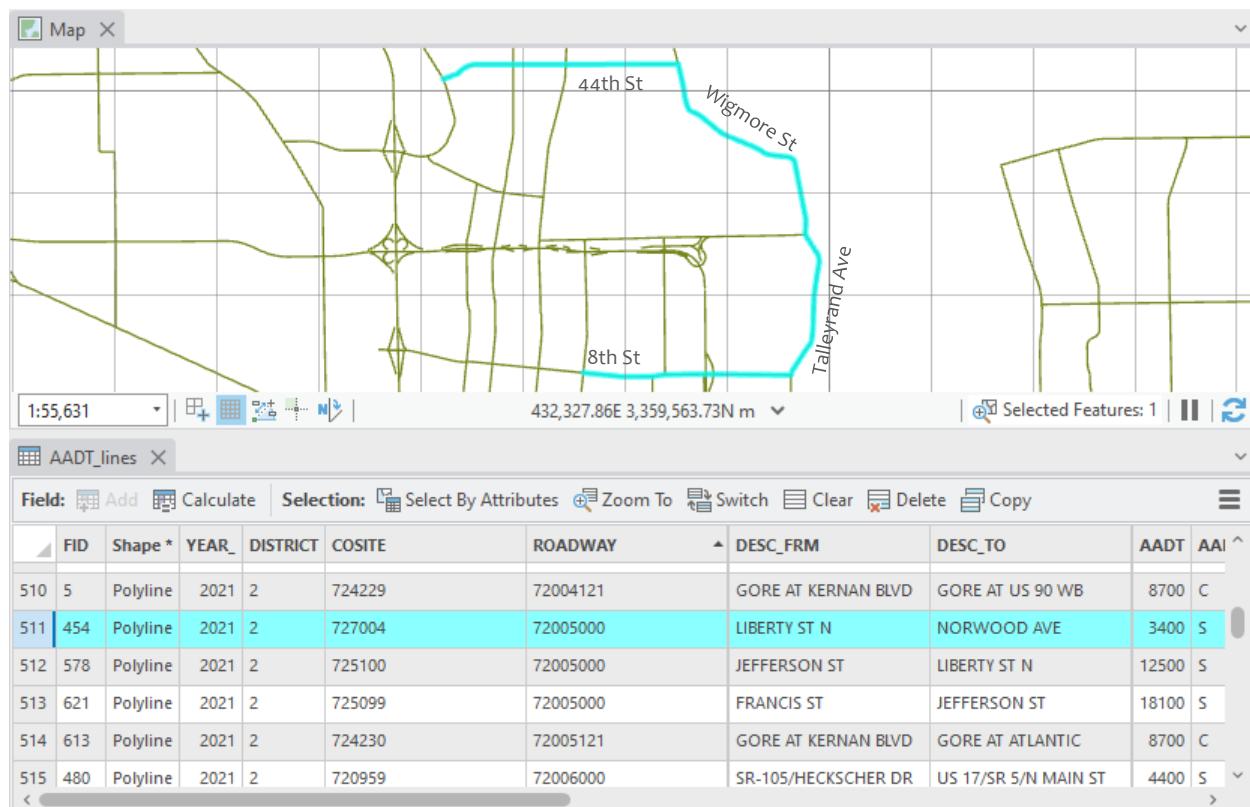

Data Cleaning

The roadway network selected was suitable for mapping of crash rates. However, modifications of the subsections were made to provide consistent naming and segments.

Modification of Roadway Segments and Names

One example of changes to make the review easier for readers is for Segment 7200500 which includes the roadways of 44th Street, Talleyrand Avenue, Wigmore Street, and 8th Street as shown in Figure 2. The segment was divided into four segments (same roadway, but different beginning and ending mile posts) to align with the roadway common names.

Figure 3. Example of Roadway Network Modification

The FDOT's naming of beginning and ending in the AADT file was also modified to express more common names. Limits where modifications were made included:

- FDOT bridge numbers
- End of segment numbers
- N/A
- Inconsistent naming of the same road (e.g., including of state road designations).

Common names for the limits of each segment were provided and consistency with nomenclature was used.

Modification of Roadway Segments at Interchanges

Many crashes along freeways in the vicinity of interchanges occurred and assigning crashes to long segments between crashes diminish the influence of these locations where there are the greatest risk of crashes due to lane change maneuvers, more complex decision making needed by drivers, merging vehicles, weaving vehicles and vehicles traveling at different speeds when accelerating or decelerating following a merge or in advance of an exit ramp.

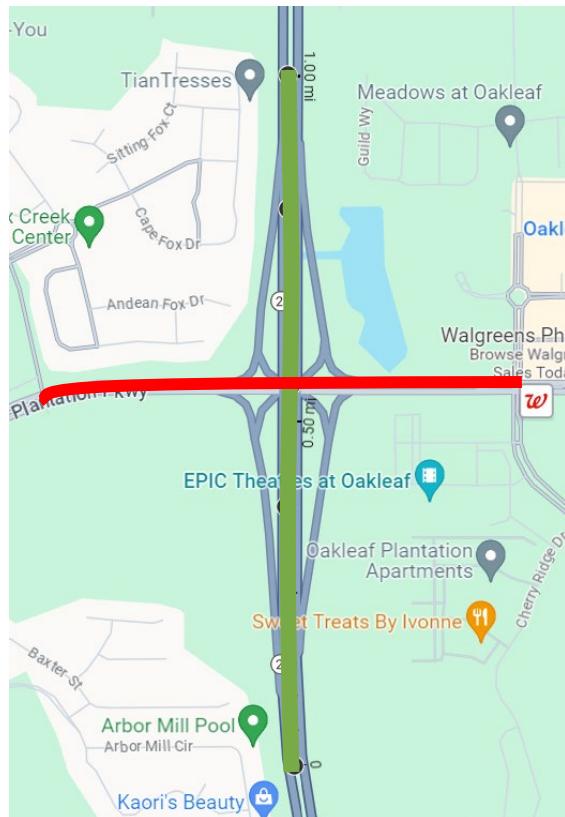

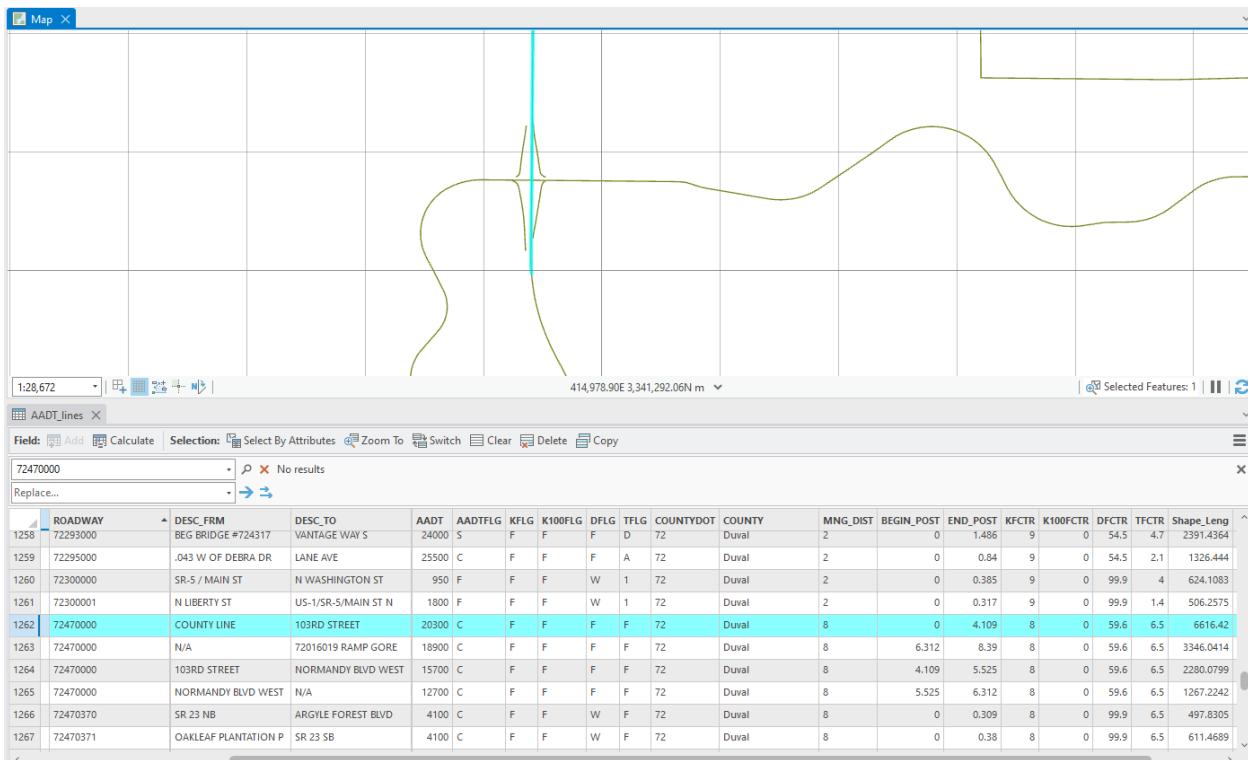

Interchanges along freeways were considered to have an influence of 1-mile minimum or 0.5 mile beyond the ramp gores. Where the influence areas of interchanges overlapped the segments were combined.

Many of the segments along arterials or collectors within interchanges began or ended at the overpass. Similarly there are more complex interactions between drivers and higher incidents of crash rates when interchanges were not considered in a segment.

To address these influence areas, new segments were created to account for the area of influence. The crashes were assigned to these new segments based on the crash location description in the Signal4Analytics record. The descriptions included distances from the overpass or ramp which aided in the assignment.

Figure 3 uses the SR-23 interchange with Argyle Forest Boulevard as an example.

Figure 4. Example of Interchange Areas

Examples of segment modifications at the interchanges are illustrated with SR-23 First Coast Expressway and Oakleaf Plantation Parkway/Argyle Forest Boulevard.

Along SR-23, the interchange is located in a segment of 7247000 with a beginning MP of 0.00 and end MP of 4.109 that begins south of the interchange. A new segment of 1.0 mile was added to 7247000 from MP 0.0 north for the interchange area on SR-23.

A new segment on Oakleaf Plantation Parkway/Argyle Forest Boulevard roadway 72000285 was created for the interchange area between the two nearest signalized intersections of approximately 0.68 miles and the segment was named Argyle Forest Blvd, Interchange Area to avoid having two names for the same segment.

The crashes were assigned to the ramps and roadway segments based on their description.

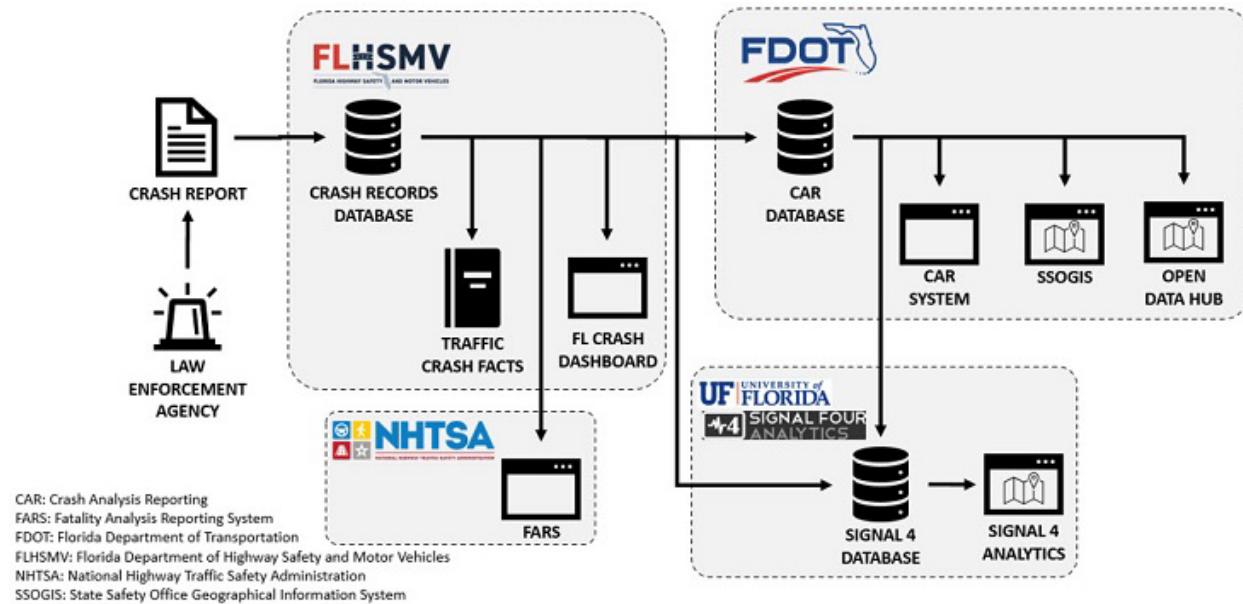

Lanes, Area Type, and Road Type

The roadway characteristics file used is based on the Roadway Characteristics Data set provided on <https://www.fdot.gov/statistics/gis/default.shtm>. The metadata are also provided on that website. The final data set was retrieved on July 10, 2023.

Crash Data

Data Sources

Several sources of crash data are available for use including the FLHSMV, FDOT Crash Analysis Report (CAR) database, National Highway Traffic Safety Administration (NHTSA) and Signal4Analytics. Guidance on the use of these different data sources is provided by the FDOT Safety Office on their [website](#).

A summary of these data sources is provided in Table 1.

Table 1. Summary of Data Sources

| Source | Purpose | Advantages | Disadvantage |
|---|---|--|---|
| Florida Highway Safety and Motor Vehicles (FLHSMV) | Florida reports with official crash statistics Statewide and county level information Provides general crash statistics in Florida in visual format with graphs and charts | Contains official finalized data and statistics for all reported traffic crashes on all roadways in a dashboard for visualization. | Updated monthly, which may be a challenge depending on what level of timeliness the data is desired to cover. |
| Crash Analysis Reporting System | Statewide database of FLHSMV crash data post-processed by FDOT to provide location coordinates and roadway data that allow users to integrate roadway and traffic characteristics to support safety analyses and studies, systemic crash analysis | The FLHSMV crash data is post-processed by FDOT to provide location coordinates and roadway data that allow users to integrate roadway and traffic characteristics/contributing factors to crashes, to support safety analyses and studies, systemic crash analysis. Fatal and serious injury crashes are post-processed immediately upon receipt from FLHSMV. Database generates summary reports based on user defined queries. | Access is restricted. Does not provide mapping capabilities, or charts and graphs. Over 500,000 crashes per year must be post-processed, so the location verification for non-fatal, non-serious injury crashes may take a few months, which may be a challenge for safety analysis requiring accurate location information for all crash severity levels. Addressing this challenge: The data is provided publicly in a GIS layer in the State Safety Office GIS system and FDOT's Open Data Hub. Currently the CAR System is being upgraded to merge with Signal 4, so the fatal and serious injury level crash locations will soon be immediately available in one system, the speed of the processing of the data will be faster, and the system will allow for the mapping capabilities and the creation of charts and graphs. In the interim, viewing the crash data in both systems allows the ability to leverage the most recent data available in both systems. |
| Signal5Analytics | Interactive, web-based system to support crash mapping and analysis needs of law enforcement, traffic engineering, transportation planning agencies, and research institutions in Florida | Contains all reported traffic crashes on all roadways, including both long and short form crashes, which is updated nightly from FLHSMV. Provides mapping and data query capabilities, and ability to create charts and | Access is restricted. Geographic location information is preliminary and has not yet been verified, which may be challenge for data analysis that relies on accurate location information for crashes of all severity levels. Does not contain additional roadway |

| Source | Purpose | Advantages | Disadvantage |
|------------------------------------|---|---|---|
| | | graphs, and contains detailed bicyclist and pedestrian involved crash details. | information to support queries and analysis on roadway related contributing factors. There is a publicly available dashboard with high level information and statistics. FDOT verifies all fatal and serious injury level crashes immediately upon receipt from FLHSMV weekly and provides this information in the Crash Analysis Reporting (CAR) System. Currently the CAR System is being upgraded to merge with Signal 4, so this will soon be available in one system. In the interim, viewing the crash data in both systems allows the ability to leverage the most recent data available in both systems. |
| Strategic Safety Office GIS | Map-based interface to provide public access to location verified crash data on public roadways | Publicly available mapping and query tool. Contains the FLHSMV crash data post-processed by FDOT to provide location coordinates and roadway data that allow users to integrate roadway and traffic characteristics/contributing factors to crashes, to support safety analyses and studies, systemic crash analysis. Fatal and serious injury crashes are post-processed immediately upon receipt from FLHSMV. | Over 500,000 crashes per year must be post-processed, so the location verification for non-fatal, non-serious injury crashes may take a few months, which may be a challenge for safety analysis requiring accurate location information for all crash severity levels. Does not include short forms and only shows locations that have been post-processed by FDOT. Currently the CAR System is being upgraded to merge with Signal 4, so the fatal and serious injury level crash locations will soon be immediately available in one system, and the speed of the processing of the data will be faster. |
| Open Data Hub | To provide in GIS format for analysts in the following formats: - GIS data portal for exploring and downloading open geospatial data | Publicly available mapping and query tool, with access to additional data layers for analysis. Contains the FLHSMV crash data post-processed by FDOT to provide location coordinates and roadway data that allow | Over 500,000 crashes per year must be post-processed, so the location verification for non-fatal, non-serious injury crashes may take a few months, which may be a challenge for safety analysis requiring |

| Source | Purpose | Advantages | Disadvantage |
|--------|--|--|---|
| | Contains crash data on all public roads in addition to other geospatial data from FDOT SSGIS | users to integrate roadway and traffic characteristics/contributing factors to crashes, to support safety analyses and studies, systemic crash analysis. Fatal and serious injury crashes are post-processed immediately upon receipt from FLHSMV. | accurate location information for all crash severity levels. Does not include short forms and only shows locations that have been post-processed by FDOT. Currently the CAR System is being upgraded to merge with Signal 4, so the fatal and serious injury level crash locations will soon be immediately available in one system, and the speed of the processing of the data will be faster. |

Source: <https://www.fdot.gov/Safety/safetyengineering/crash-data-systems-and-mapping>

[Signal4Analytics](#) was selected for use in this study. Data was collected for the period of January 1, 2018, to December 31, 2022. The Signal4Analytics' [Data Dictionary](#) identifies the information provided. The final data was downloaded on August 28, 2023. The Signal4Analytics files for events, vehicles, bicyclists and pedestrians were employed.

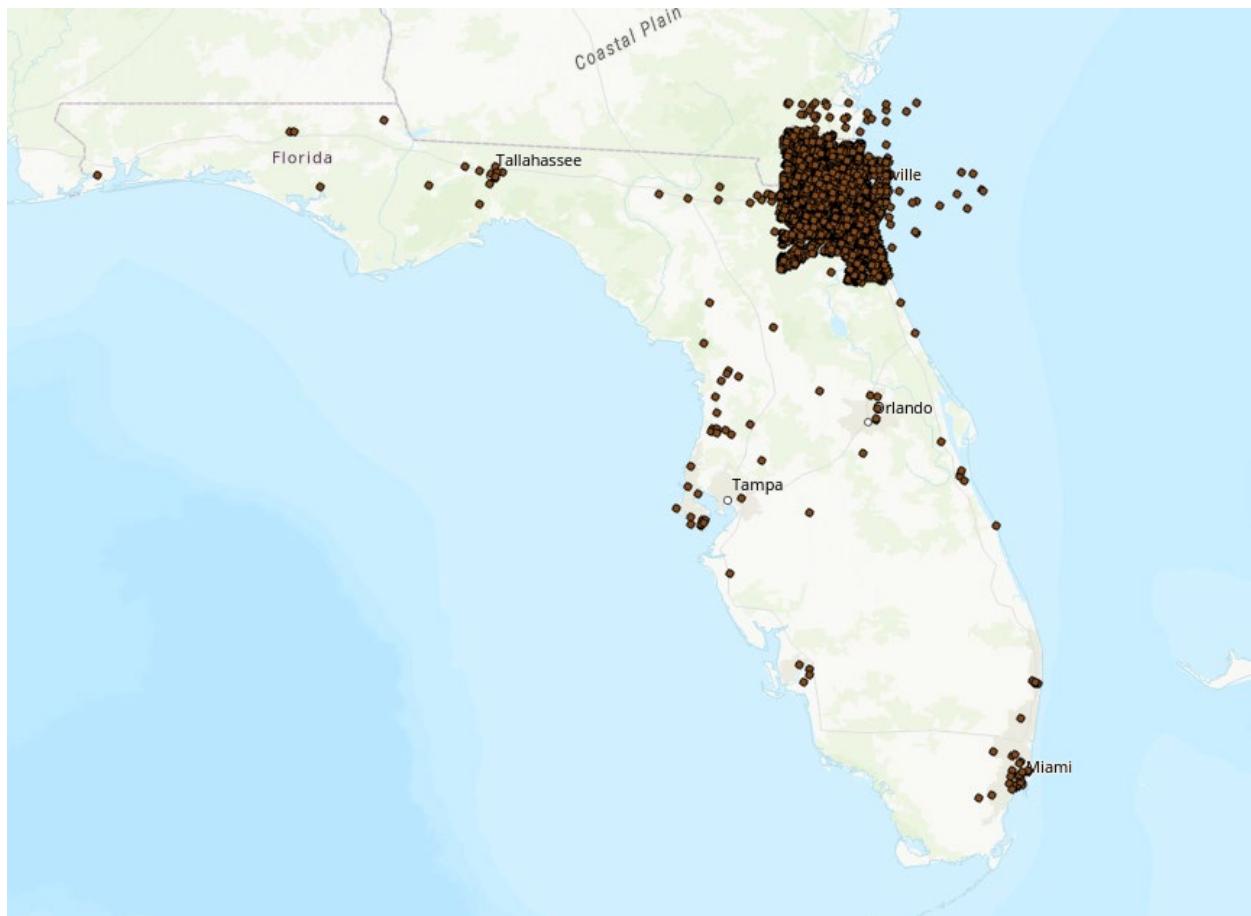

The data file included 263,095 crashes.

Data Cleaning

Crash Location

The data in Signal4Analytics was coded by officers in the field using latitude and longitude based on the download of data for each county as shown in Figure 4.

Figure 5. Latitude and Longitude of Crashes

Source: Signal4Analytics, August 29, 2023.

Figure 6. Clay County Download Crash Event Analysis

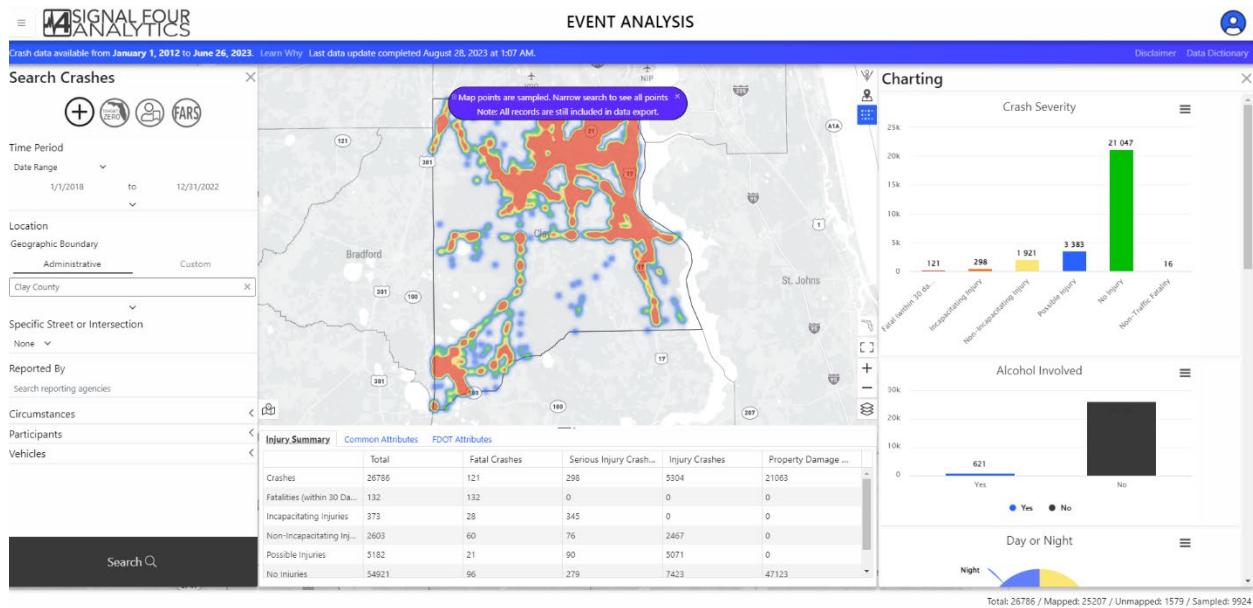

Figure 7. Duval County Download Crash Event Analysis

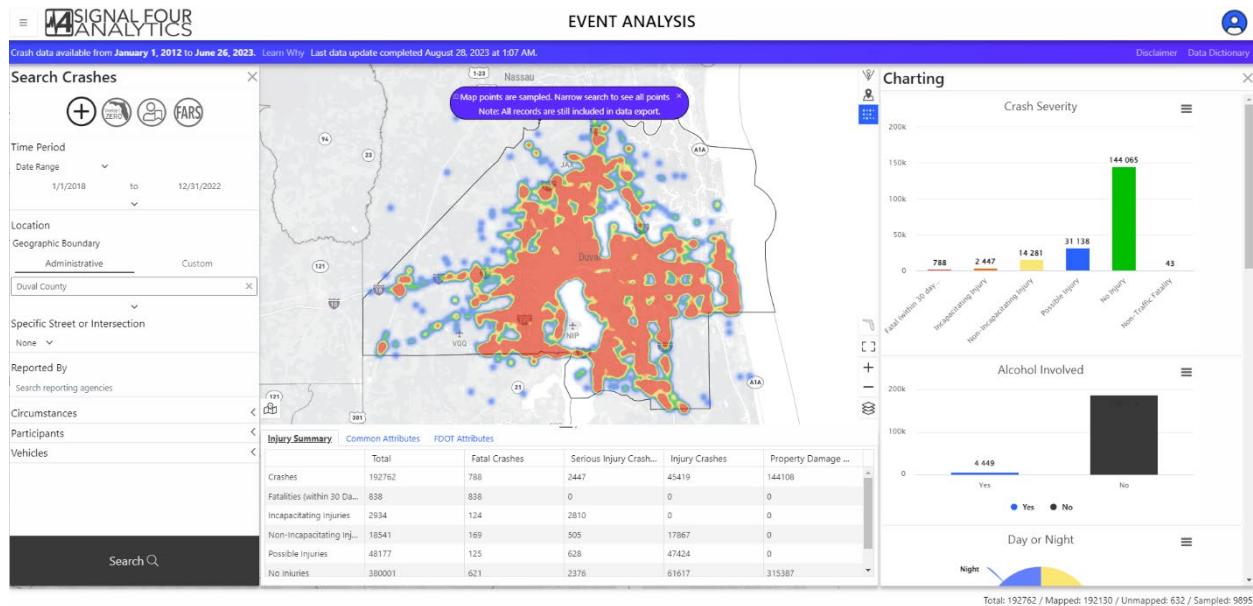

Figure 8. Nassau County Download Crash Event Summary

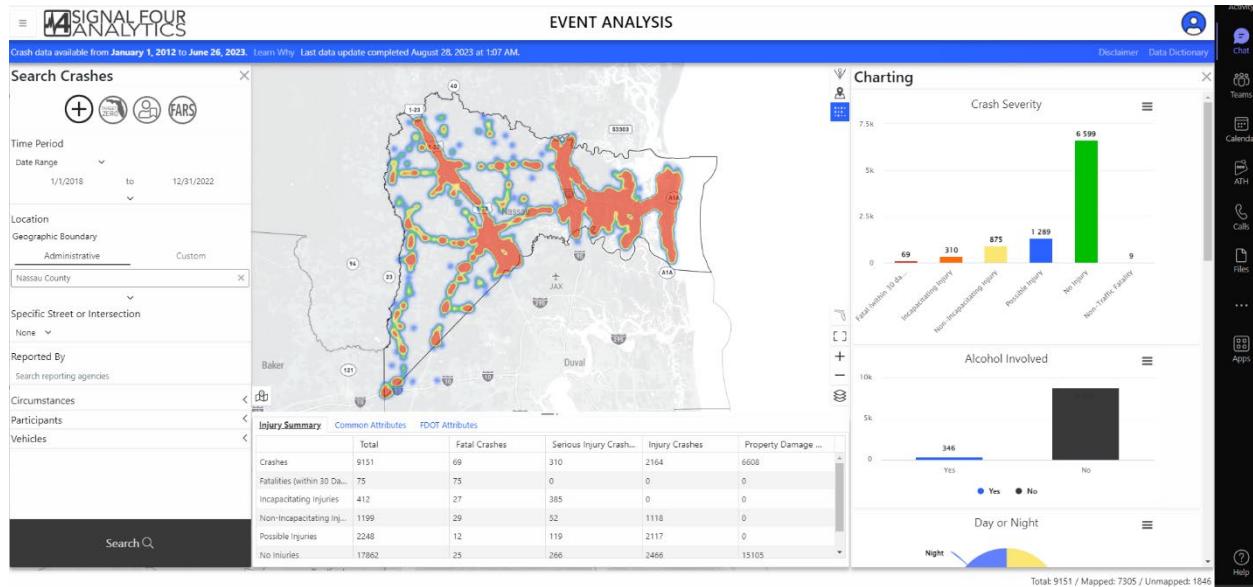

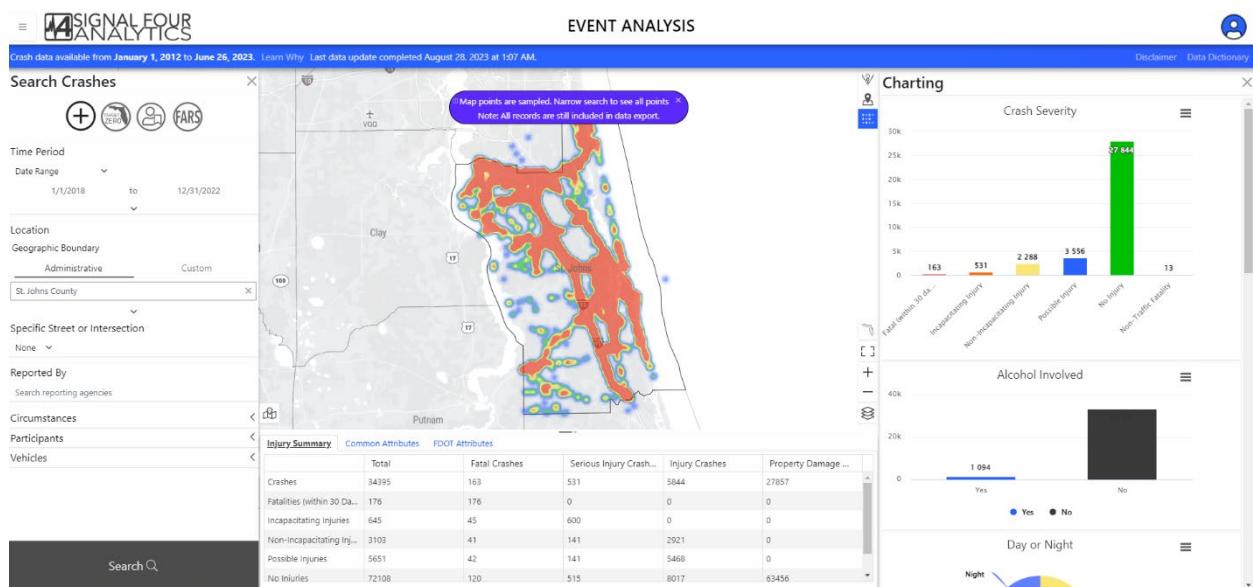

Figure 9. St. Johns County Download Crash Event Summary

The location of each crash record was reviewed to check the location (county, segment, mile post). The officer's entry of the On_Street data field is considered the most reliable of data entered by the officer in the field. The On_Street description was compared to the segment assigned. The following logic was used to assign a final location.

1. If the “main street” On_Street field roadway name and the FDOT segment roadway matched, then no change to the segment was made.
2. If the “main street” On_Street field roadway name and the FDOT roadway segment name did NOT match, then,
 - a. If the crash occurred within the intersection area of influence of the “main street” and the intersecting street was another roadway segment included in the analysis, then the segment and location was changed to the other location.
 - b. If the crash occurred within the intersection area of influence of the “main street” and a minor street, the crash location did not change.

The intersection area of influence was defined based on FDOT's [Access Management Guidebook](#) which established 440-ft as the minimum connection spacing standard based on the functional area of influence for an intersection.

In March 2023, Signal4Analytics released an updated version of the data where roadway segments and mileposts were provided for the state and local roadway network. Based on a screening review, the location assigned in the buffer was consistent with the buffer analysis performed by the project team. The changes in the latitude and longitude made in Signal4Analytics were to adjust the latitude and longitude to appear on the nearest roadway segment, but not to review the location from the coded data. This data was not used since 135,000 of the crash locations had been manually reviewed by that time.

Of the 263,095 crashes, 186,947 were identified with an ON_STREET location or in the buffer analysis with a local street name intersecting one of the network roadways.

Based on a review of the buffer-selected location and the final location based on ON-STREET field, 22.32% of crashes were assigned to the wrong segment or were on local roads (not at intersections with one of the studied facilities).

Table 2. Summary of Review of Crash Buffer Analysis

| County | % Match | % Changed |
|--------------|---------------|---------------|
| Clay | 85.76% | 14.24% |
| Duval | 78.96% | 21.04% |
| Nassau | 87.69% | 12.31% |
| St. Johns | 72.44% | 27.56% |
| Total | 77.68% | 22.32% |

Match = the ON_STREET roadway name matches the segment.

An additional 3,122 records occurred in parking lots based on either the description of the crash location or the coding of the location in the crash type field.

This results in a total of 183,825 crashes that were included in the analysis.

Comparison to FDHSMV

The FDHSMV produces a dashboard of crash statistics that is updated with a +/- 30 day lag in the crash occurrence. A comparison of the crash statistics reported for the entire counties was performed.

The number of crashes considered exceeds the total number of crashes reported by FLDHSMV in each year. The FLDHSMV considered only “codable” crashes in their analysis based on discussions the North Florida TPO had with representatives of FLDHSMV. No detailed investigations occurred as to which of the crash record files considered were excluded by FDHSMV or why. Table 5 summarizes the percentage of crashes.

Table 3. Comparison of Total Crashes Reported by FLDHSMV

| Year | Clay | Duval | Nassau | St. Johns | Region |
|--------------|------|-------|--------|-----------|--------|
| 2018 | 133% | 117% | 117% | 132% | 120% |
| 2019 | 125% | 119% | 118% | 139% | 122% |
| 2020 | 120% | 117% | 114% | 128% | 119% |
| 2021 | 119% | 117% | 102% | 133% | 118% |
| 2022 | 107% | 118% | 100% | 114% | 116% |
| Total | 121% | 118% | 110% | 129% | 119% |

Signal4Analytics and FDHSMV both report fatalities and injuries that are verified. So there is a greater confidence in the comparison of these data sets. Since only a portion of the entire network in each county was considered, not all fatalities or injuries reported by FDHSMV were considered as summarized in Table 6 and Table 7.

Table 4. Comparison of Fatalities with FDHSMV

| Year | Clay | Duval | Nassau | St. Johns | Region |
|--------------|------|-------|--------|-----------|--------|
| 2018 | 95% | 89% | 89% | 94% | 90% |
| 2019 | 96% | 85% | 88% | 84% | 87% |
| 2020 | 83% | 88% | 94% | 87% | 88% |
| 2021 | 85% | 91% | 82% | 92% | 90% |
| 2022 | 76% | 89% | 79% | 88% | 87% |
| Total | 86% | 88% | 87% | 89% | 88% |

Table 5. Comparison of Injuries with FDHSMV

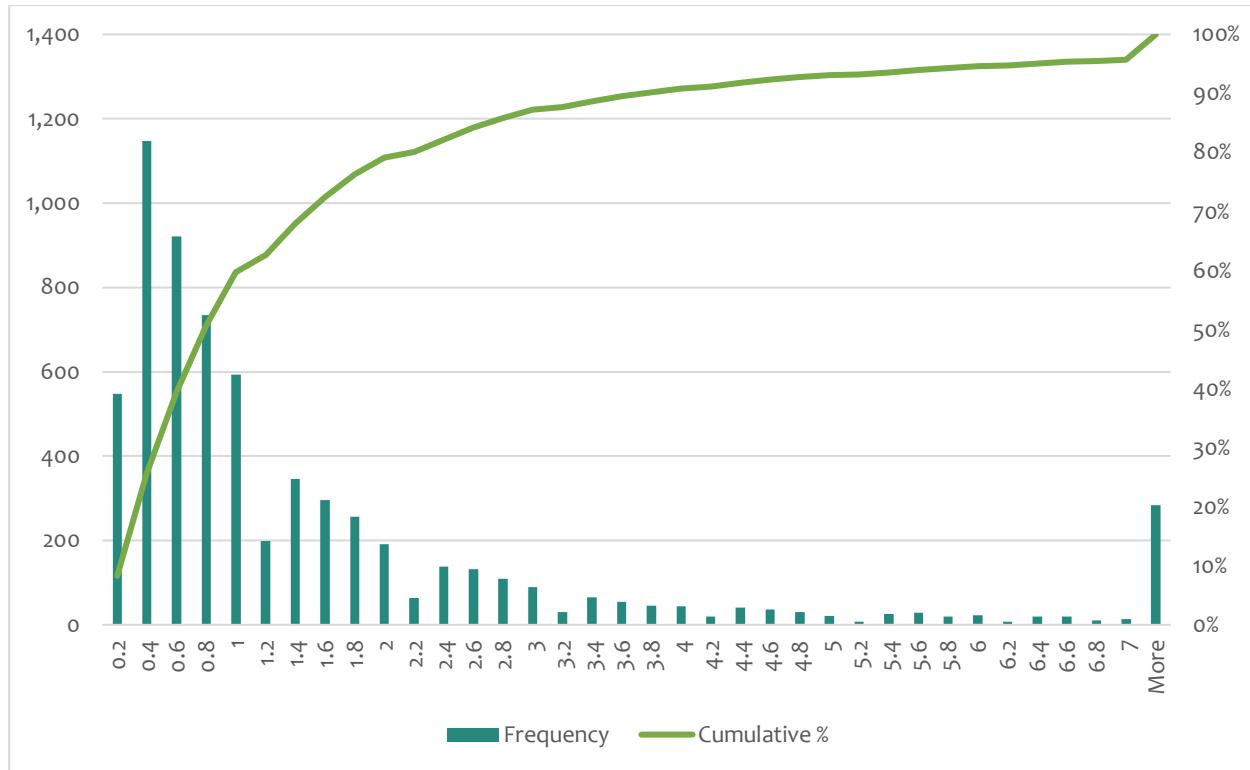

| Year | Clay | Duval | Nassau | St. Johns | Region |
|--------------|------|-------|--------|-----------|--------|
| 2018 | 89% | 85% | 90% | 88% | 86% |
| 2019 | 84% | 84% | 87% | 89% | 84% |
| 2020 | 82% | 86% | 86% | 89% | 86% |
| 2021 | 76% | 85% | 86% | 88% | 85% |
| 2022 | 73% | 86% | 76% | 78% | 84% |
| Total | 81% | 85% | 85% | 86% | 85% |

Crash Rate Outlier Treatment

Over the five year period there were 7,754 crash rate calculations available. The summary statistics are provided in Table 2 and the cumulative frequency distribution is shown in Figure 9.

Table 6. Descriptive Statistics Before Outliers Removed

| Statistic | 2018 | 2019 | 2020 | 2021 | 2022 | 5-Year Average |
|--------------------------|-----------|-----------|-----------|-----------|-----------|----------------|
| Mean | 1.988 | 1.692 | 1.309 | 1.468 | 1.405 | 1.576 |
| Standard Error | 0.158 | 0.109 | 0.084 | 0.101 | 0.095 | 0.087 |
| Median | 0.527 | 0.607 | 0.572 | 0.655 | 0.541 | 0.692 |
| Mode | - | - | - | - | - | - |
| Standard Deviation | 6.213 | 4.281 | 3.313 | 3.958 | 3.748 | 3.446 |
| Sample Variance | 38.606 | 18.328 | 10.979 | 15.668 | 14.046 | 11.874 |
| Kurtosis | 147.180 | 100.130 | 297.727 | 480.042 | 272.960 | 146.574 |
| Skewness | 10.247 | 8.567 | 13.800 | 17.826 | 13.269 | 9.369 |
| Range | 124.533 | 73.195 | 85.813 | 117.208 | 94.185 | 74.080 |
| Minimum | - | - | - | - | - | - |
| Maximum | 124.533 | 73.195 | 85.813 | 117.208 | 94.185 | 74.080 |
| Sum | 3,081.834 | 2,624.102 | 2,030.934 | 2,277.613 | 2,179.765 | 2,443.858 |
| Count | 1550 | 1551 | 1551 | 1551 | 1551 | 1551 |
| Confidence Level (95.0%) | 0.310 | 0.213 | 0.165 | 0.197 | 0.187 | 0.172 |
| Mean + 2 Std Dev | 14.42 | 10.25 | 7.94 | 9.38 | 8.90 | 8.47 |

Figure 10. Cumulative Frequency Distribution

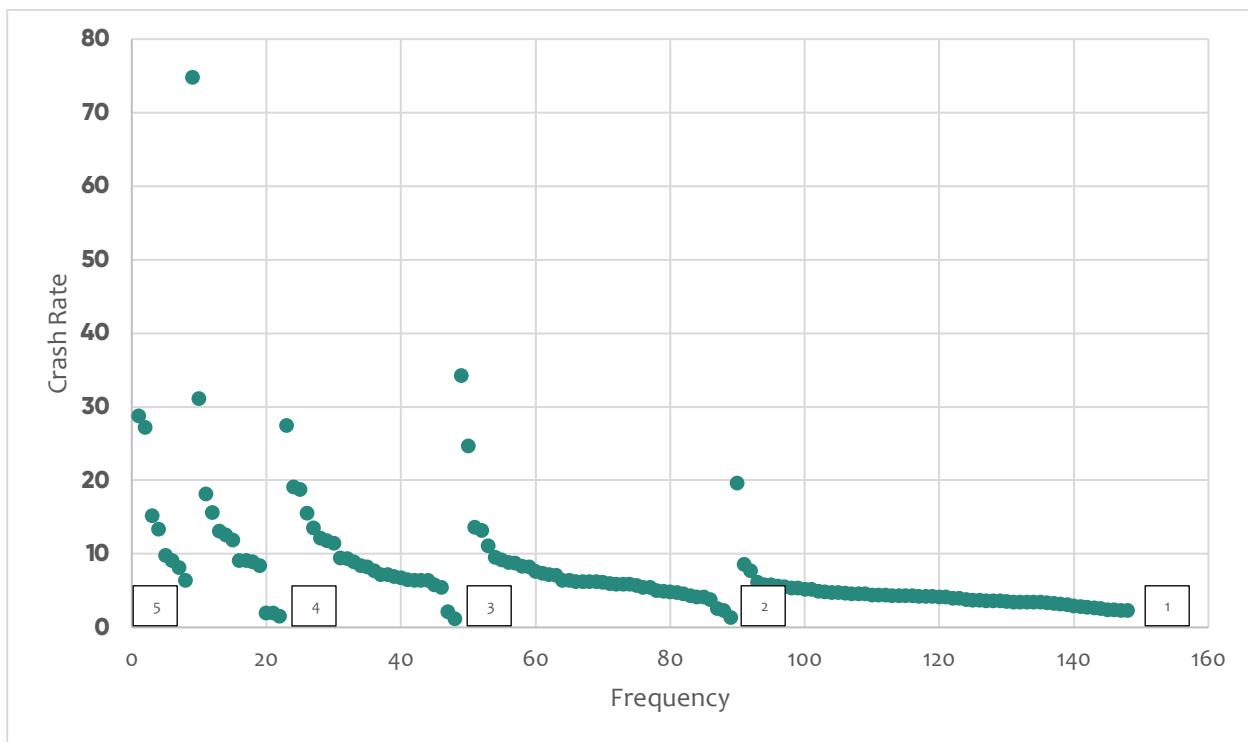

98.61% of the crash rates are less than 6.47 (the plus two standard deviations for all crash rate records). There were 147 segments, or 0.89% percent, which had at least one year's crash rate removed as an outlier.

With the outliers removed, the descriptive statistics for the crash rates by year are summarized in Table 3 and the distribution of the outliers 5-year average crash rate is shown on Figure 10.

Based on an analysis of the outliers the segments shown in Table 4 have three or more outliers and the segments have high crash frequencies and should be treated separately for the purposes of comparative crash rate analysis.

Table 7. Descriptive Statistics after Outlier Treatment

| Statistic | 2018 | 2019 | 2020 | 2021 | 2022 | 5-Year Average |
|--------------------|-------------|-------------|-------------|-------------|-------------|-----------------------|
| Mean | 0.843 | 0.924 | 0.862 | 0.941 | 0.860 | 0.950 |

These segments and associated crashes were removed from the statistical analysis of comparing crash rates by facility type, area type and number of lanes. They are not removed from ranking of facilities by crash rate or in the identification of needs using other criteria.

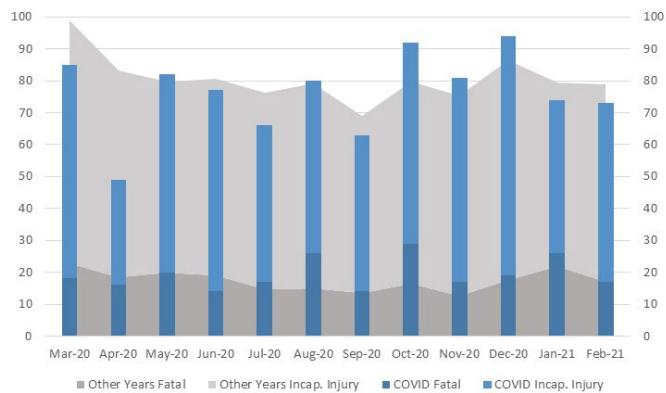

Trends and Conditions

The following summarize the results of the analysis of crash data. Additional detail is provided in the Technical Report.

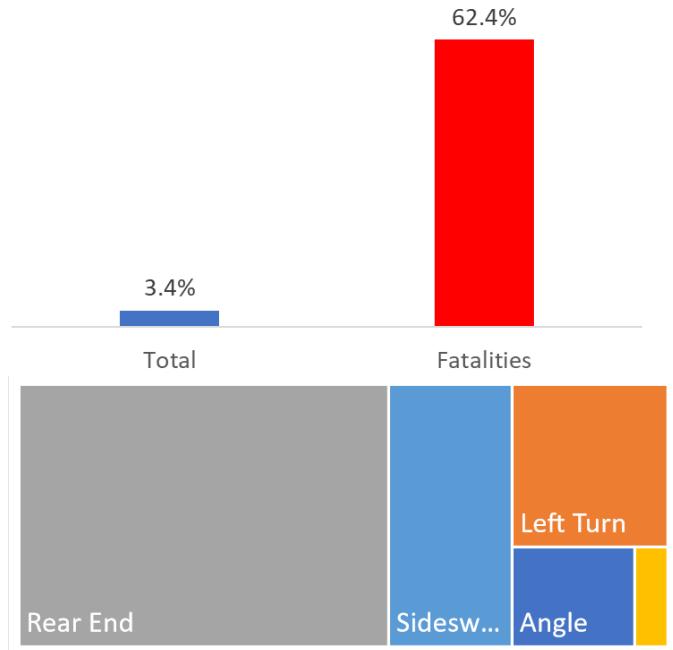

There were fewer crashes during the COVID pandemic and fewer persons traveling. The number of crashes occurring since COVID have returned to pre pandemic levels.

During months with the greatest influence from COVID (March 2020 through January 2021), there were more fatalities per month than during the other four years of the study despite there being less travel. When the serious injuries and fatalities are combined, there were more severe crashes in October and December 2020 but the total were similar or less. Researchers hypothesize this is a result of drivers taking greater risk when driving.

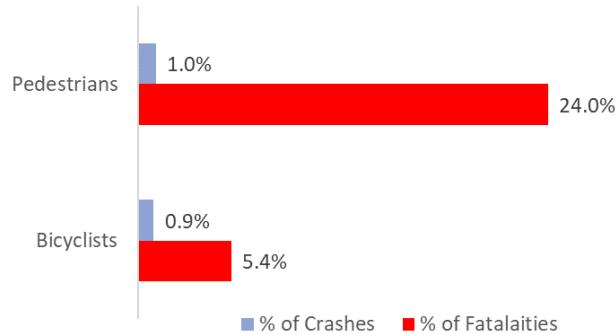

Impaired driving is the most significant contributor to fatalities. Alcohol and drugs are a contributing factor in **62% of fatalities** but only 3.4% of crashes.

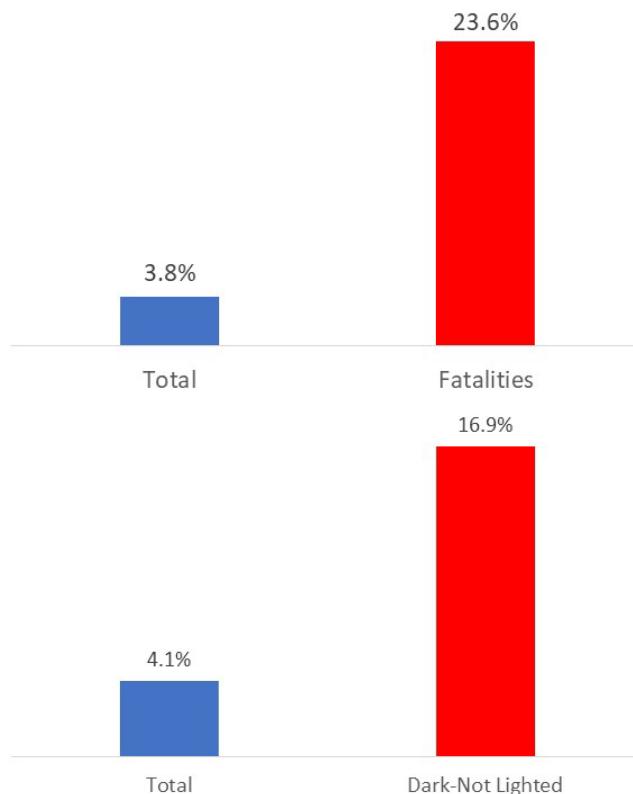

Nearly 75% of crashes, **30% of fatalities** and 77% of injuries are congestion-related or influenced by the number of driveways and median openings along a corridor.

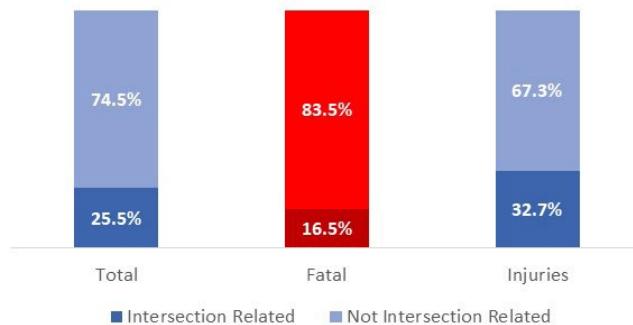

Bicyclists and pedestrians are the most vulnerable travelers on the road. Over the last five years 58 bicyclists and 256 pedestrians died in crashes. Although they account for only 1.89% of crashes they represent **29.4% of fatalities**.

Drivers and passengers who do not wear seatbelts account for only 3.8% of crashes but **24% of fatalities**.

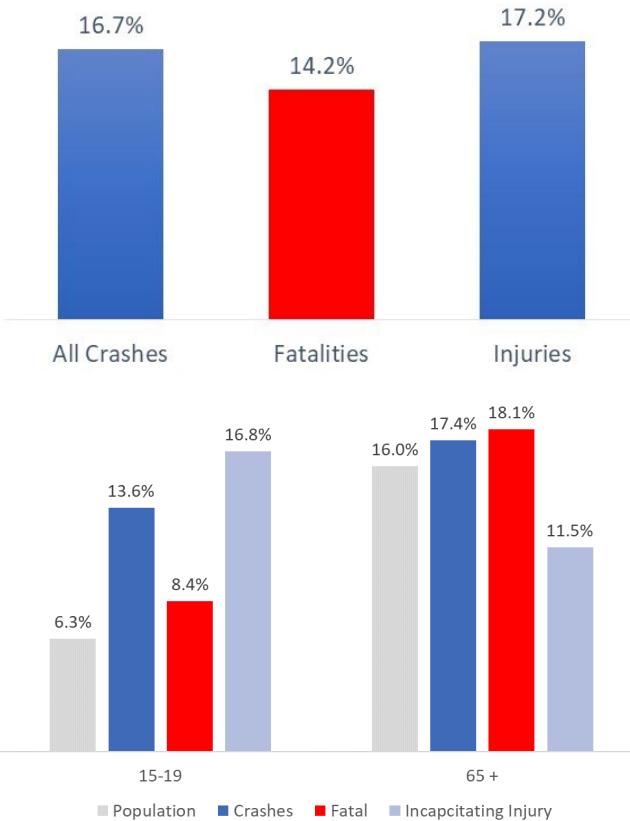

Another contributor to the frequency of crashes is if lighting is present on a roadway. **One-in-six** fatalities occur under dark conditions without lighting.

About 25% of crashes 34% of the congestion and access-related crashes occur at intersections resulting in **16% of the fatalities** and 33% of the injuries.

Weather is a significant contributing factor to crashes. About one in six crashes and **14% of fatalities** occur when there is ice, standing water or wet pavement condition.

Teenage drivers (years 15-19) are involved with a greater proportion of crashes and incapacitating injuries compared to other age groups.

Senior drivers (65+ years) are involved with a slightly greater proportionate number of crashes and fatalities.

Prioritization Analysis

The following factors were considered when assessing the priority of segments.

Methodology

Crash Severity and Economic Impact

The KABCO injury scale is used by the FDOT and Federal Highway Administration (FHWA) to measure the severity of motor vehicle accident injuries, as well as how those injuries impact the costs. When law enforcement officers respond to the scene, they will assign one of the following ratings to the crash.

- K: Someone was killed at the crash scene.
- A: Someone suffered incapacitating injuries requiring medical care transport or hospitalization. Examples include amputations, broken or distorted limbs, or a crushed chest.
- B: There is an evident injury, but it is non-incapacitating in nature. Examples include minor injuries, such as minor lacerations or bruises.
- C: Someone may have been injured.
- O: Law enforcement has observed no apparent injuries from the scene of the crash.

This scale differs from the conventional: fatal, serious injury and property-damage-only severity rating previously used.

Based on a report published in February of 2023, the National Highway Traffic Safety Administration determined that the officer's ability to assess the severity of crashes at the scene is not very reliable when compared to the actual medical records. <https://www.nhtsa.gov/press-releases/traffic-crashes-cost-america-billions-2019> (page D-2)

As noted elsewhere in this report, data systems that collected both KABCO and [Abbreviated Injury Scale (AIS) created by the Association for the Advancement of Automotive Medicine using medical records] AIS injury severities indicate that KABCO ratings are not very meaningful.

Large numbers of crash victims are miscoded regarding their actual injury levels, with many people coded as A – incapacitating injury actually being uninjured and many coded as uninjured actually experiencing injuries. For this reason, we believe that analysis of motor vehicle injuries is more meaningful when injuries are first expressed, either directly or through a translator (medical records compared to the police reports) many “O” injuries are actually injured based on the (medical records).

Table 8 summarizes the serious injuries and Table 9 summarizes the incapacitating injuries that were evaluated and coded in Signal4Analytics as a serious injury vs. an incapacitating injury. The difference in these tables demonstrate the complexity with applying a scale to the severity of injury.

Table 9. Summary of Serious Injuries

| YEAR | CLAY | DUVAL | NASSAU | ST JOHNS | TOTAL |
|--------------|------------|--------------|------------|------------|--------------|
| 2018 | 106 | 704 | 117 | 112 | 1,039 |
| 2019 | 68 | 710 | 131 | 141 | 1,050 |
| 2020 | 76 | 613 | 59 | 156 | 904 |
| 2021 | 61 | 772 | 104 | 192 | 1,129 |
| 2022 | 79 | 684 | 91 | 132 | 986 |
| Total | 390 | 3,483 | 502 | 733 | 5,108 |

Table 10. Summary of Incapacitating Injuries

| YEAR | CLAY | DUVAL | NASSAU | ST JOHNS | TOTAL |
|--------------|------------|--------------|------------|------------|--------------|
| 2018 | 71 | 520 | 88 | 83 | 762 |
| 2019 | 59 | 503 | 96 | 90 | 748 |
| 2020 | 52 | 464 | 49 | 137 | 702 |
| 2021 | 43 | 570 | 67 | 129 | 809 |
| 2022 | 50 | 504 | 68 | 93 | 715 |
| Total | 275 | 2,561 | 368 | 532 | 3,736 |

Most motor vehicle crash cases involve some degree of financial loss. According to the [NHTSA](#), the economic impacts of crashes include lost productivity and wages, medical, legal and court costs, emergency service, insurance administration, congestion, property damage, quality of life, and workplace losses.

The values shown in Table 11 are used by FDOT to estimate the economic impact of crashes according to the KABCO scale. These values represent the composite value per crash based on the most severe event.

Table 11. KABCO Economic Cost by Crash

| Severity | Value |
|--|--------------|
| Fatal (K) | \$10,890,000 |
| Severe injury or incapacitating injury (A) | \$888,030 |
| Moderate or non-Incapacitating injury (B) | \$180,180 |
| Minor or someone may have been injured (C) | \$103,950 |
| Property damage only or no injury (O) | \$7,700 |

Source: Florida Department of Transportation State Safety Office's Crash Analysis Reporting (CAR) System, analysis years 2015 through 2019. Published by FDOT State Safety Office on 2/23/2022 as referenced in the 2023 FDOT Design Manual.

These economic values are composites. Table 12 summarizes the number of persons involved in each level of severity by crashes by severity type. Of the 995 crashes that would be assigned an economic impact of \$10,890,000 from Table 11, there were 1,068 fatalities, 203 incapacitating injuries, 460 other injuries and 783 other persons involved in the crash in our region.

Table 12. Comparison of Signal4Analytics Crash Severity Data

| Severity | Crashes | Persons | | | | |
|---------------------------|---------|----------------|---------------------------|-------------------------------|---------------------|---------------|
| | | Fatalities (K) | Incapacitating Injury (A) | Non-incapacitating Injury (B) | Possible Injury (C) | No Injury (O) |
| Fatality (K) | 995 | 1,068 | 203 | | 273 | 187 |
| Serious Injury (A) | 3,022 | - | 3,533 | | 675 | 900 |
| Injury (B) | 48,339 | - | - | 20,220 | 50,731 | 67,539 |
| No Injury (O) | 131,469 | - | - | - | - | 321,240 |
| Total | 183,825 | 1,068 | 3,736 | | 21,168 | 51,818 |
| | | | | | | 392,530 |

In the February 2023 report by the NHTSA, the comprehensive costs for each person in KABC0 scale in 2019 is summarized in Table 13 in 2019 and 2022 dollars. The 2022 value was estimated based on the ratio of the FDOT Design Manual cost in 2019 vs. 2022. An average of \$150,200 was used for the non-incapacitating injuries.

Table 13. KABC0 Costs per Person

| Severity | 2019 Value | 2022 Value |
|---|-------------------------|--------------------------------|
| Fatal (K) | \$11,258,495 | \$11,490,600 |
| Severe injury or incapacitating injury (A) | \$919,740 | \$936,000 |
| Moderate or non-Incapacitating injury (B) | \$199,814 | \$206,900 |
| Minor or someone may have been injured (C) | \$109,154 | \$109,200⁽¹⁾ |
| Injury, severity unknown | \$133,071 | \$134,500 |
| Average of Non-incapacitating injury | | \$150,200 |
| Property damage only or no injury (O) | \$15,113 ⁽²⁾ | \$7,700 |

Source: The Economic and Societal Impact of Motor Vehicle Crashes, 2019 (Revised February 1, 2023), Appendix Table D-1.

Notes: (1) The FDOT Design Manual shows a decrease between 2019 and 2022. The value was maintained and rounded. (2) The value exceeds the FDOT Design Manual. \$7,700 but is used for consistency.

Crash Frequency

The total number of crashes that occurred on a segment and the total number of fatalities or serious injuries was one dimension of crash rates used in assessing priorities.

Crash Rates

Crash rates calculated as the number of crashes per vehicle mile traveled was also considered. The crash rate reflects the number of crashes based on the volume of traffic allowing for the comparative analysis of the relative frequency of crashes.

Lighting Analysis

As part of the analysis of crashes that occurred in conditions identified by officers as “dark-not lighted” a conceptual benefit/cost analysis was performed to assess the priority of the segment to determine if more detailed lighting justification analysis may be appropriate. Generalized costs per mile were estimated using the following sources and are summarized in Table 11.

Table 14. Generalized Life-cycle Costs per Mile for Lighting

| Lanes | Annual O&M | O&M Life Cycle | Construction | Net Present Value Lighting Costs per Mile |
|-------|------------|----------------|--------------|--|
| 1 | | | | \$394,322 |
| 2 | \$ 40,000 | \$ 444,800 | \$343,844 | \$788,644 |
| 4 | \$ 50,000 | \$ 556,000 | \$343,844 | \$899,844 |
| 6 | \$ 60,000 | \$ 667,200 | \$530,090 | \$1,197,290 |

Notes: 1 lane estimated based on ½ of a 2-lane roadway.

Annuitization factor of 11.12 used based on 20 years and i=7%

Sources:

https://fdotwww.blob.core.windows.net/sitefinity/docs/default-source/programmanagement/estimates/documents/cost-per-mile-model-reports/suburban/suburban-01.pdf?sfvrsn=605cb3ef_4

https://fdotwww.blob.core.windows.net/sitefinity/docs/default-source/programmanagement/estimates/documents/cost-per-mile-model-reports/urban/urban-22.pdf?sfvrsn=cdad38b2_4

A crash reduction factor of 35% was used based on the “Reduction in Nighttime” crashes rate provided in <https://www.cmfclearinghouse.org/results.php>. This value is conservative considering the typical range of crash modification factor was 50% to 68% and most studies were in the 65% range.

Potential Countermeasures

Most safety plans focus on four “E’s” of countermeasures –Enforcement, Education, and Emergency Response.

Enforcement

Exhibit 11 identifies locations with high frequency of impaired driving where law enforcement may wish to consider enhanced enforcement which can be used to reduce impaired driving or speeding.

Education

FDOT conducts a wide range of public safety campaigns to address major driver behavior contributors to fatal and serious injury crashes such as:

OCCUPANT PROTECTION SAFETY

SAFETY CRASH DATA GUIDANCE

Additional campaigns by the North Florida TPO would only dilute the effectiveness of these programs by over saturating the public.

Emergency Response

The North Florida TPO funds a portion of the costs to operate Road Rangers programs within the region and support Transportation Systems Management and Operations (TSM&O) strategies as part of the Transportation Improvement Program (TIP). These strategies are identified through cooperation with the FDOT and local governments and are not enumerated in this plan.

Engineering

To focus on **preventing** fatalities and serious injuries with proven strategies candidate locations for additional engineering evaluation were identified.

Candidate Project Evaluation

A prioritization analysis was performed to identify the top 25 priorities for the following.

- Priority segments were identified based on the sum of the rank of each segment for total crashes, economic impact and crash rate.
- Bicyclist and pedestrian priorities were selected based on the economic impact of the crashes for facilities that were coded with no sidewalk or no bike lane. A Google Maps review of each segment was performed for candidate projects for the top 25 to verify the sidewalk and bike lane coding.
- Priority segments for lighting were based on segments where coded as “dark-not lighted” and ranked based on an estimated benefit/cost ratio. The benefit/cost ratio was calculated using a 35% crash reduction factor for the dark-not lighted crashes only. Lighting costs were estimated based on the lighting component in the FDOT’s per-mile costs in the Long-Range Estimates used as the basis for typical facility types by number of lanes. A Google Maps review of each segment was performed that was a candidate for the top 25.
- Lane departure crashes were evaluated in rural corridors and ranked based on the economic impact.
- Segments were combined when contiguous. If a short segment that had a low ranking was located between two segments with very high ranking, the three segments were combined into a single project.
- Interchange priorities were ranked based on the sum of the economic impact for the influence area on the mainline, ramps and influence area on the crossroad. The area of influence area for the mainline was determined based on $\frac{1}{2}$ mile from the physical gore on the longest ramp and on the crossroad to the nearest signal or appropriate segment break, such as a change from four-lanes within the interchange to two lanes on the approach.
- Intersections were ranked based on the total number of crashes within 400-ft of the intersection. A 400-ft buffer was selected based on Rule-14-97, Access Management, which defines the minimum connection distance from the intersection of 440-ft. The access management rules were based on research identifying the functional area of the intersection considering typical queue lengths. This captures many of the rear-end crashes that would not be considered with a smaller radius.

A review of the FDOT Tentative Work Program, prior year Adopted Work Program, and known local programs such as Jacksonville Transportation Authority’s Mobility Works Local Option Gas Tax (LOGT) or the Clay County LOGT was performed. Where projects are programmed or under construction, they were not advanced to the final ranking since safety should be considered in the project, include 3R projects.

The recommended priority projects are based on the highest ranked projects in each category and the total economic impact. Equity was considered based on the population in each county.

Table 15 and Figure 19 show the recommended list of priority projects for inclusion in the 2050 Long Range Plan. The intent is to select projects on an annual basis for funding from using TPO funding. They are ranked by County but may not be selected in priority order for funding. The projects will be selected based on the budget available and rotated by County. Table 17 through Table 22 and Figure 20 through Figure 25 summarize the priorities within each group.

Table 15. Priority Projects for Stakeholder Selection

Based on the total number of crashes at each intersection.

Figure 25. Intersection Priorities

Analysis of Crash Rates

One of the analysis performed was to determine if there was a statistically significant difference between crash rates for various road types and number of lanes. The road segments were grouped into strata for urban and rural facilities and classified based on the median type and number of lanes. Groups with small numbers, such as the reversible lanes on Bay Street, were removed.

Table 23 summarizes the crash rates by group.

A normality assumption was made for the crash rates within each stratum and classification and student's t-tests were used to determine if there were statistically significant differences between the crash rates.

The crash rates within each stratum and classification by number of lanes is not statistically significantly different at a 95%-ile level of confidence. The level of significance that there is a statistically significant difference of the crash rates based on the stratum and classification is summarized in Table 25. Table 26 summarizes the level of significant for the difference in crash rates based on the median type and number of lanes. Table 27 summarizes the level of significance for the difference in crash rates based on the median type and area type.

A correlation analysis was also performed and Pearson's Coefficient R² values are provided in Table 28. The only significant correlation between variables, an R² > 0.5, are highlighted in green and summarized below.

- Crash rates in St. Johns County and Duval County are inversely related. That is, crash rates in St. Johns are less than in Duval County.
- A median barrier has a statistically more significant effect on crash rates on six-lane roadways than other factors. This is likely due to most of the six lane roadways with barriers being Interstate facilities within the urban area.
- Undivided two-lane roadways have a statistically significant greater contribution to crash rate than other characteristics.
- Increases in the speed limit on one-lane ramp sections correlated to a higher crash rate.

Table 23. Summary Statistics for Crash Rates by Median Type, Number of Lanes and Area Type

Emerging Data Sources

New data sources are emerging that provide opportunities to develop new insights into safety issues once a priority is identified to proactively identify locations where driver behavior can lead to new crashes. These data rely on information collected by probes or video being processed through artificial intelligence and machine learning.

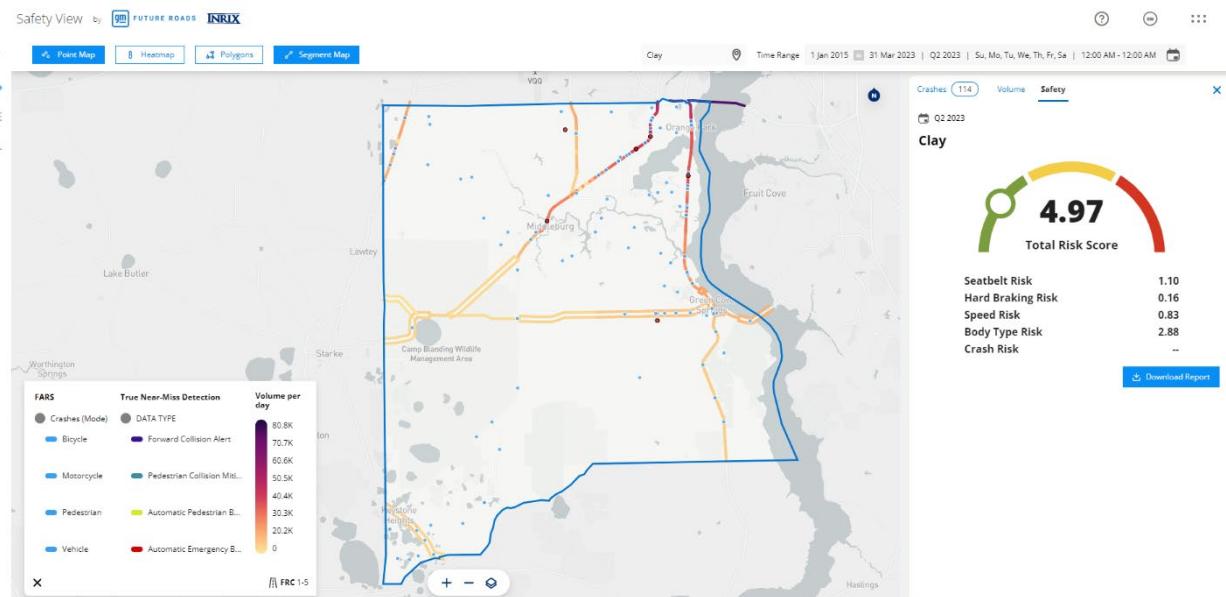

Probe Data

One example of probe vehicle data is Safety View powered by General Motors Future Roads & INRIX. This data uses information collected through on-board devices in vehicles. INRIX uses this data and other public data sources to analyze and map:

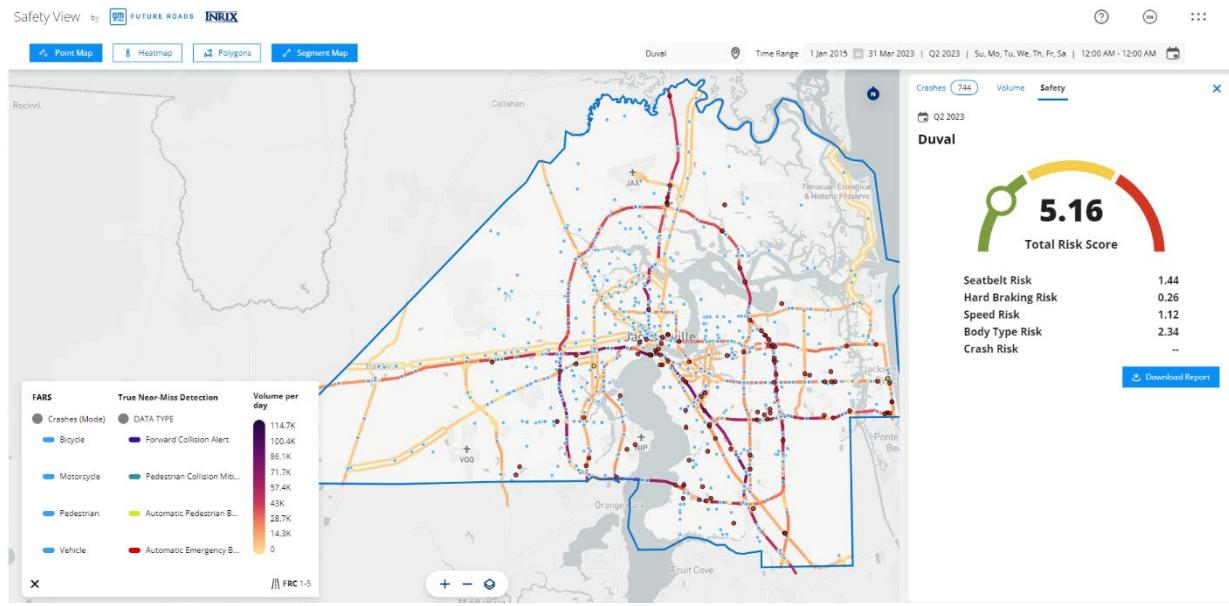

- **fatal crash locations** as blue dots (Jan 2015 to Mar 2023)
- **near-miss events** of automatic emergency braking event – vehicle to vehicle = red dot, vehicle to pedestrian = yellow dot (April 2023 to June 2023)
- **estimated daily volume** (April 2023 to June 2023) – note all links available but only major ones displayed when at Countywide zoom level.
- **countywide average total risk score** (April 2023 to June 2023) in right side panel

Video Machine Learning

The Institute of Electrical and Electronics Engineering (IEEE) states in [Advances in Road Safety Technology - IEEE Public Safety Technology Initiative](#)

Visual evidence is the key to any investigation into road safety. Areas that have better, and more comprehensive, camera technology make it easier to identify hazards. A road camera may catch a distracted driver, poor weather conditions, or dangerous traffic patterns. With this knowledge, engineers can properly identify and produce solutions to actual road safety issues. This technology is in the interest of road user safety. If an incident occurs and is recorded, the technology can create an alert for future events. These alerts can include determining factors like wet roads or excessive traffic during a certain time of day.

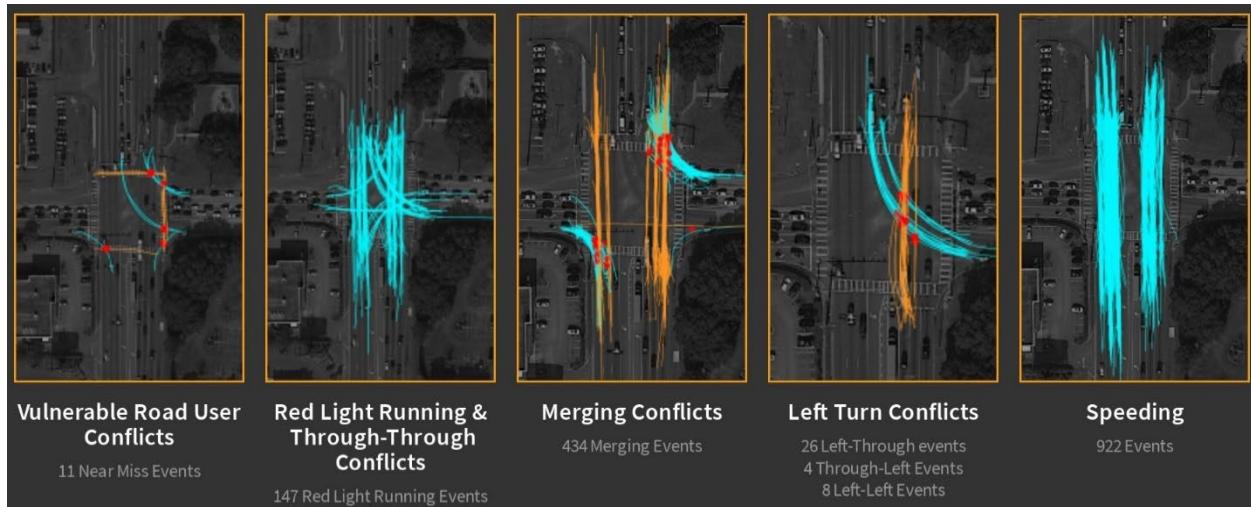

Street Simplified uses video analytics to capture, analyze and report on vehicle and non-motorized movements and to perform pattern analyze to create a list of potential mitigation measures.

A pilot project was completed along Wells Road from SR-21 Blanding Boulevard to US-17 Park Street in May 2023. Multiple drivers traveled along the site and recorded video to analyze driver behavior and video from CCTV located at the intersections were used to analyze potential hazards and recommend mitigation methods.

For example, the key findings of the analysis of the intersection of Wells Road and SR-21 Blanding Boulevard are shown on

Figure 30. Wells Road at SR-21 Blanding Boulevard Findings

Source: Street Simplified

The following recommendations were made:

- Add right-turn signalization/separate right-turn phasing
- Add sidewalk and enhance crossings
- Improve street lighting and pedestrian crosswalk lighting
- Modify signal phasing and timing to reduce red light running and speeding
 - Advance detection plus free mode operation
 - Evaluate yellow plus all change intervals
- Enhance pedestrian safety
 - Prohibit right-turn on red
 - Install urban leading bicyclists or pedestrians intervals
- Modify phase transition pair to increase effective clearances
- Speed enforcement
- Speed limit reduction
- Queue detection to reduce intersection blockage
- Evaluate signal phase and timings to coordinate signals

Statistical Abstract

The following tables summarize the regional statistics by county and year for key items of interest. The following results were concluded.

Table 29. All Crashes

| Year | Clay | Duval | Nassau | St. Johns | Total Crashes |
|----------------------|---------------|----------------|--------------|---------------|----------------|
| 2018 | 3,776 | 28,263 | 1,454 | 4,759 | 38,252 |
| 2019 | 3,366 | 28,001 | 1,341 | 4,682 | 37,390 |
| 2020 | 3,021 | 24,889 | 1,216 | 4,214 | 33,340 |
| 2021 | 3,329 | 28,505 | 1,214 | 5,031 | 38,079 |
| 2022 | 2,821 | 28,563 | 1,099 | 4,281 | 36,764 |
| Total Crashes | 16,313 | 138,221 | 6,324 | 22,967 | 183,825 |

Table 30. Fatalities

| Year | Clay | Duval | Nassau | St. Johns | Total Crashes |
|----------------------|------------|------------|-----------|------------|---------------|
| 2018 | 18 | 127 | 16 | 32 | 193 |
| 2019 | 25 | 135 | 15 | 26 | 201 |
